		B. Actual Space Width	---	.0555 (1.410)		
		2. HPC Front Hub (72-35-05) External Spline (See Figure 805, Sheet 2)				
		A. Effective Tooth Thickness	---	.0476 (1.209)		
		B. Actual Tooth Thickness	.0412 (1.046)	---		
		3. Fit			.0015 (0.038)	---

I. Special Torques

HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-04

	I		New Part Reference			
Ref.	F		Dimensions		Limits	
No.	R	Description	Min	Max	Min	Max
730	A	Nut, Variable Stator Clevis Retaining (See Figure 803, Sheets 3, 4, 5, And 11) See 72-35-00, Assembly-03 (Task 72-35-00-400-003) See 72-35-03, Assembly-01 (Task 72-35-03-440-001)				
732	A	Nut, Bellcrank Spacer Clevis Retaining (See Figure 803, Sheets 5 And 11) See 72-35-03, Assembly-01 (Task 72-35-03-440-001)				
733	A	Nut, Actuating Cylinder Retaining (See Figure 803, Sheet 10) See 72-35-00, Assembly-03 (Task 72-35-00-400-003)				
734	A	Bolt, Stage 7 HPC Lever (See Figure 803, Sheet 11) See 72-35-03, Assembly-01 (Task 72-35-03-440-001)				
735	A	Compressor Stator Actuator Rod End Bearing Retaining Nut (See Figure 803, Sheet 6) See 72-35-00, Assembly-03 (Task 72-35-00-400-003)				
736	A	Bolt And Nut Torquing Procedure, Turbine Case Cooling Air Valve Actuator Ground Cable See 72-35-00, Assembly-04 (Task 72-35-00-400-004)				
737	A	Nut, Bellcrank Spacer Clevis Retaining (See Figure 803, Sheet 3) See 72-35-03, Assembly-01 (Task 72-35-03-440-001)				
738	A	Nut, Bellcrank Spacer Clevis Retaining (See Figure 803, Sheets 5 And 11) See 72-35-03, Assembly-01 (Task 72-35-03-440-001)				

Ref. No.	I F R	Description	New Part Reference Dimensions		Limits	
			Min	Max	Min	Max
739	A	Variable Stator Mount Stud Retaining Nuts (See Figure 803, Sheet 7) See 72-35-00, Assembly-03 (Task 72-35-00-400-003)				
1550	A	Compressor Tierod Nut (See Figure 801, Sheet 2 And, Figure 802, Sheet 2) See 72-35-01, Assembly-01 (Task 72-35-01-440-001)				
1551	A	Vane Arm Retaining Bolt (See Figure 801, Sheet 3, And Figure 802, Sheet 3) See 72-35-02, Assembly-01 (Task 72-35-02-440-001)				
1552	A	Stage 6 Borescope Plug (See Figure 801, Sheet 5, And Figure 802, Sheet 5) See 72-35-02, Assembly-01 (Task 72-35-02-440-001)				
1553	A	HPC Case Axial Flange Bolt - Nut (See Figure 801, Sheet 5 And Figure 802, Sheet 5) See 72-35-00, Assembly-01 (Task 72-35-00-400-001)				
1554	A	Stages 5, 10, And 14 Borescope Plugs (See Figure 801, Sheets 5, 9, 14, And Figure 802 Sheets 5, 9, And 14) See 72-35-00, Assembly-01 (Task 72-35-00-400-001)				
1556	A	Stages 8 And 12 Borescope Plugs (See Figure 801, Sheets 9, And 12, And Figure 802, Sheets 9, And 12) See 72-35-00, Assembly-01 (Task 72-35-00-400-001)				
1558	A	Synchronizing Ring Runner Pad Bolt (See Figure 807, Sheet 1) See 72-35-00, Assembly-02 (Task 72-35-00-400-002)				

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1560	A	Tiebolt Nuts, HPC Drum Rotor (Stages 13, 14, And 15) Disk Assembly (See Figure 801, Sheet 10 And Figure 802, Sheet 10) See 72-35-01, Assembly-01 (Task 72-35-01-440-001)				
1561	A	Tiebolt Nuts, HPC Drive Turbine Shaft (See Figure 801, Sheet 13 And Figure 802, Sheet 13) See 72-35-39, Assembly-01 (Task 72-35-39-440-001)				

J. Special Assembly Procedure

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
618	A	Compressor Stator Lever - Set Bracket - Shim Fitting (See Figure 803, Sheet 8) See 72-35-00, Assembly-03) (Task 72-35-00-400-003)				
749	A	Variable Stator Mount Assembly Instruction For Expanding Retaining Stud (See Figure 803, Sheets 1, And 7) See 72-35-00, Assembly-03 (Task 72-35-00-400-003)				
760	A	Turbine Vane And Blade Cooling Air Valve Position Switch - Installation See 72-35-00, Assembly-04 (Task 72-35-00-400-004)				
1401	A	Arm Assembly End Clearance - Select Spacer To Obtain (See Figure 801, Sheet 3) See 72-35-02, Assembly-01 (Task 72-35-02-440-001)				

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−04

Ref. No.	I F R	Description	New Part Reference Dimensions		Limits	
			Min	Max	Min	Max
1580	A	Flange Seating Procedure (See Figure 801, Sheet 14 And Figure 802, Sheet 14) See 72−35−00, Assembly−01 (Task 72−35−00−400−007) And See 72−35−04, Assembly−01 (Task 72−35−04−440−001)				
2101 2102 2103 2104	A	Shim Procedure For Unison Ring Runners And Spacers And Clearances For Runners (See Figure 807, Sheets 1 And 2) See 72−35−00, Assembly−02 (Task 72−35−00−400−002)

HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-05

Task 72-35-00-200-005:

1. Functional Check Inspection - Blade Tip Clearance Evaluation - High Pressure Compressor

A. Purpose

(1) The purpose of this procedure is to control HPC blade tip clearances during the build of an HPC module so as to maintain an adequate surge margin and to ensure good compressor stability as well as good engine performance.

B. Equipment And Materials Required

Special Tools:
PWA 86668 HPC Stator Fixture (Optional)

C. General

(1) Blade Tip Clearance = (Rubstrip ID - Rotor OD)/2

(a) Blade Tip Clearance: This refers not only to average blade tip clearance but to local min-max clearance limits as well.

1 Calculate average blade tip clearances by Procedure E.(3)(a), below, using the measurements from Procedure E.(1) and E.(2), below. See 72-35-00, Inspection/ Check-04 (Task 72-35-00-990-001), Reference Numbers 1320 through 1330 for average blade tip clearance limits.

2 Calculate local min-max blade tip clearances by Procedure E.(3)(b), below using the measurements from Procedure E.(1) and E.(2), below.

(b) Rubstrip ID: This measurement requires pre-assembly of the HPC static structure (stators and cases). Measure Stages 5 through 15 rubstrips by Procedure E.(1), below.

(CONTINUED)

(c) Rotor OD: There are three alternatives for making these measurements as follows:

1 Alternative number one measures overall rotor diameters (rotor disks with blades) and depends on the availability of high−speed, rotor lade tip grinding machines that utilize dynamic laser optical probe measurement techniques. Measure by Procedure E.(2)(a), below.

2 Alternatives two and three both involve separate measurement of rotor disk Z−Plane diameters and blade lengths. These are then combined to obtain the rotor blade tip diameter for each each stage. Measure by Procedures E.(2)(b) and E.(2)(c), below.

(2) The following conditions are permitted.

(a) One (1) stage within the 5th through 8th stage can be up to +0.005 inch (0.127 mm) over maximum average clearance at assembly and/or maximum local limits at assembly. See 72−35−00, Inspection/ Check−04 Task 72−35−00−990−001, Reference Numbers 1320 through 1323.

(b) One (1) stage within the 9th through 12th stage can be up to +0.005 inch (0.127 mm) over maximum average clearance at assembly and/or maximum local limits at assembly. See 72−35−00, Inspection/ Check−04 Task 72−35−00−990−001, Reference Numbers 1324 through 1327.

D. Prerequisites

(1) Ensure that all rubstrips in a given stage have the same serial number since these segments are originally manufactured as a matched set.

(2) Ensure that the correct stator to HPC inner rear case interchangeability requirements are followed as defined in SB PW4ENG 72-229, SB PW4ENG 72-396 and SB PW4ENG 72-403.

(3) Rubstrips should be inspected for wear and damage in the blade tip rub area and reused only if the parts meet Engine CIR Manual limits. New or repaired parts should be used as necessary to ensure the optimum blade tip clearance at final assembly.

(4) All other dimensional and visual inspection requirements for stators, as specified in the Engine CIR Manual, should be followed, including those for localized wear near stator segment split lines.

(5) Ensure that all other HPC static structure parts are inspected and meet Engine CIR Manual limits prior to reuse in a repaired HPC.

(6) Ensure that antigallant is applied to stator segments as specified in 72-35-00, Assembly-01 (Task 72-35-00-400-001).

(7) Ensure that the proper seating of the compressor static structure is achieved, for SB PW4ENG 72-229 rotor stator assemblies only, by taking the drop dimension defined in 72-35-00, Assembly-01 Task 72-35-00-400-001.

(8) Ensure that there is no intermixing, within a stage, of Pre SB PW4ENG 72-395 blades (blade tips not coated with aluminum oxide) with Post SB PW4ENG 72-395 blades (blade tips coated with aluminum oxide).

(9) When mating rubstrips and/or supporting stator structure have been refurbished or replaced to EM limits, all blades in affected Stages 9 through 15, should have aluminum oxide tips and blade lengths must meet EM limits.

(10) When all blades are replaced, blades in Stages 9 through 15 should have aluminum oxide tips and blade lengths must meet EM limits.

HIGH PRESSURE COMPRESSOR (HPC) − INSPECTION/CHECK−05

(11) When replacing more than ten blades in a stage, the replacement blades cannot vary in length more than ±0.004 inch (±0.102 mm) from the average length of all existing blades in the stage.

(12) When ten or less blades are replaced in a stage the replacement blades cannot vary more than ±0.004 inch (±0.102 mm) from the average length of at least ten existing blades in the stage.

(13) If all blades in a stage are not being replaced, replacement blades must be approximately evenly spaced around the disk.

E. Procedure
See Figure 801.

(1) Rubstrip ID measurements:

(a) Measure rubstrip diameters for HPC Stages 5, 6 and 7 as installed in the HPC front case. Refer to dimensional inspection, 72−35−40, Inspection/Check−04 in the PW4000 Series CIR, PN 51A357.

(b) Measure the rubstrip diameters for Stages 8 through 15, as pre−assembled in the static structure (stators and cases). Refer to 72−35−00, Assembly−05 (Task 72−35−00−400−005). Use of PWA 86668 HPC Stator Fixture provides an accurate measurement of the rubstrip diameters by clamping the HPC rear stators axially forward in the HPC rear case. This more accurately simulates the stator running positions.

(c) Rubstrip diameters must be measured at the axial gage point for each stage. Refer to Table 801 as applicable for the axial location of gage points for each stage, measured from H−Flange front face (Surface G). See Figure 802.

(d) Two alternative methods are acceptable for making these measurements: the preferred method, when maintenance shops have the equipment available, is to use coordinate measuring machine (CMM) equipment.

(e) When CMM equipment is not available, use measurement gage tooling, similar to that referenced in 72−35−00, Assembly−05 (Task 72−35−00−400−005). For each stage, measure diameters at a minimum of sixteen (16) angular positions.

(2) Rotor OD measurements: there are three acceptable methods for measuring rotor OD, as follows:

(a) The preferred method, when maintenance shops have the equipment available, measures overall rotor diameters (rotor disks with blades) on high−speed, rotor blade tip grinding machines that utilize dynamic laser optical probe measurement techniques. See Table 802 for the axial location of gage points, relative to the No. 2 bearing rear seal seat (Plane CF) on the HPC front hub for the measurement of rotor blade tip diameters. See Figure 803.

(b) The second method is recommended when a high−speed, rotor blade tip grinding machine, with a dynamic laser optical probe, is not available. This involves separate measurement of blade lengths and rotor disk Z−Plane diameters. Z−Plane diameters are obtained by measurement across gage blocks that fit into disk blade slots. Refer to Table 803 for references to these measurements. Blade lengths are measured with special tooling at each blade dimensional inspection. Refer to Table 804 for these inspections. Combine blade lengths and Z−Plane diameters as follows to obtain rotor blade tip diameters.

Rotor OD = Z−Plane Diameter +
2 (Average Blade Length)

(c) The third method is similar to the second method, above, except that, instead of using a measured value for Z−Plane diameter, it uses the "nominal" blueprint Z−Plane diameter. This is an acceptable method, at least for an interim period, until Z−Plane measurement tooling is available. Refer to Table 803 for references to these measurements.

(3) Use the above measurements of rubstrip ID and rotor OD to calculate average and local min−max blade tip clearances for each stage as follows:

(a) Average Blade Tip Clearance = (Average Rubstrip ID − Average Rotor OD)/2. Compare the calculated values with the blade tip clearance limits specified in the Table Of Limits, 72−35−00, Inspection/Check−04 (Task 72−35−00−990−001), Reference Numbers 1320 through 1330. To enhance good stability experience, the individual stage average tip clearances for Stages 13 through 15 must conform to the Table of Limits Reference Numbers 1328 through 1330 values, respectively.

(b) Local Minimum Blade Tip Clearance =
(Minimum Rubstrip ID − Maximum Rotor OD)/2
Local Maximum Blade Tip Clearance =
(Maximum Rubstrip ID − Minimum Rotor OD)/2

(c) If minimum tip clearances are not met, it is permissible to use PWA 86668 HPC Stator Fixture to retain the rear stators in the outer case while skim cutting (local machining) the rubstrip(s) to remove the tight areas and meet the minimum average and minimum local tip clearances. If necessary, skim cut the rubstrips by 72−35−00, Repair−01 (Task 72−35−00−300−001).

Stage	Distance From H−Flange* (Surface G)	Chapter/Section	Task Number
8	0.223 inch (5.664 mm)	72−35−59, Inspection/Check−04	72−35−59−200−004
9	3.124 inch (79.350 mm)	72−35−59, Inspection/Check−04	72−35−59−200−004
10	5.869 inch (149.073 mm)	72−35−60, Inspection/Check−04	72−35−60−200−004
11	8.277 inch (210.236 mm)	72−35−60, Inspection/Check−04	72−35−60−200−004
12	10.627 inch (269.926 mm)	72−35−61, Inspection/Check−04	72−35−61−200−004
13	13.058 inch (331.673 mm)	72−35−61, Inspection/Check−04	72−35−61−200−004
14	15.243 inch (387.172 mm)	72−35−62, Inspection/Check−04	72−35−62−200−004
15	17.398 inch (441.909 mm)	72−35−62, Inspection/Check−04	72−35−62−200−004

*NOTE: Surface G is the front face of H−Flange, which is the front flange of the HPC (outer) rear case assembly.

(Task 72−35−00−200−005)

HIGH PRESSURE COMPRESSOR (HPC) - INSPECTION/CHECK-05

Task 72-35-00-990-012:

1. Functional Check Inspection - Blade Tip Clearance Evaluation - High Pressure Compressor (HPC)

A. Purpose

(1) The purpose of this procedure is to control the HPC blade tip clearance during the assembly of the HPC module. Blade tip clearance must be evaluated to make sure the HPC has sufficient surge margin, good stability, and gives good engine performance.

B. Prerequisites

(1) Grind and measure the axial compressor rotor assembly blade tips. Refer to 72-35-01, Assembly-03, CONFIG-2 (Task 72-35-01-440-026).

(2) Pre-assemble the high compressor HPC outer airseal set. Refer to 72-35-04, Assembly-01 (Task 72-35-04-440-001).

(3) Machine and measure the HPC outer airseal set. Refer to 72-35-04, Assembly-02 (Task 72-35-04-440-002).

C. Equipment And Materials Necessary - None

D. Procedure

(1) The axial compressor rotor assembly blade tips were machined and measured in 72-35-01, Assembly-03, CONFIG-2 (Task 72-35-01-440-026). You must have a record that gives the actual measured dimensions, including the average diameter, the minimum local, and maximum local diameter for each stage.

(2) The 5th through 15th stage rubstrip diameters were machined and measured in 72-35-04, Assembly-02 (Task 72-35-04-440-002). You must have a record that gives the actual measured dimensions, including the average diameter, the minimum local and maximum local diameter for each stage.

(3) Calculate the average blade tip clearance for each stage as follows:

(a) Find the average rubstrip diameter.

(b) Find the average rotor outside diameter.

(c) Subtract the average rotor diameter from the average rubstrip diameter.

(d) Divide the remainder by 2 to find the average radial clearance at assembly.

(e) The average clearance at assembly must be within the limits shown in Table 801 for each stage.

Ref. No.	Description	Nominal Clearance	Average Clearance At Assembly Min	Average Clearance At Assembly Max	Local Limits Min	Local Limits Max
1320	Stage 5 HPC Blade (Tip Clearance) Clearance	0.067 (1.702)	0.055 (1.40)	0.074 (1.88)	See NOTE.	
1321	Stage 6 HPC Blade (Tip Clearance) Clearance	0.057 (1.448)	0.050 (1.27)	0.064 (1.63)	See NOTE.	
1322	Stage 7 HPC Blade (Tip Clearance) Clearance	0.060 (1.524)	0.053 (1.35)	0.067 (1.70)	See NOTE.	
1323	Stage 8 HPC Blade (Tip Clearance) Clearance	0.067 (1.702)	0.060 (1.52)	0.074 (1.88)	See NOTE.	
1324	Stage 9 HPC Blade (Tip Clearance) 0.036 INCH (0.914 mm) Clearance	0.033 (0.838)	0.030 (0.762)	0.036 (0.914)	See NOTE.	
1325	Stage 10 HPC Blade (Tip Clearance) Clearance	0.030 (0.762)	0.027 (0.686)	0.033 (0.838)	See NOTE.	
1326	Stage 11 HPC Blade (Tip Clearance) Clearance	0.038 (0.965)	0.035 (0.889)	0.041 (1.041)	See NOTE.	
1327	Stage 12 HPC Blade (Tip Clearance) Clearance	0.030 (0.762)	0.027 (0.686)	0.033 (0.838)	See NOTE.	

Blade Tip Clearance And Local Limits
Table 801

Ref. No.	Description	Nominal Clearance	Average Clearance At Assembly Min	Average Clearance At Assembly Max	Local Limits Min	Local Limits Max
1328	Stage 13 HPC Blade (Tip Clearance) Clearance	0.047 (1.194)	0.044 (1.118)	0.050 (1.270)	See NOTE.	
1329	Stage 14 HPC Blade (Tip Clearance) Clearance	0.047 (1.194)	0.044 (1.118)	0.050 (1.270)	See NOTE.	
1330	Stage 15 HPC Blade (Tip Clearance) Clearance	0.047 (1.194)	0 .044 (1.118)	0.050 (1.270)	See NOTE.	

NOTE: For Stage 5, the local Min. and Max. clearance variation must be within +0.012/− 0.017 inch (+0.305 mm)/(−0.432 mm) about the nominal clearance. You do not have to include up to five short blades in the local maximum clearance calculation as per the extended minimum radius limits as specified in 72−35−01, Assembly−03, CONFIG−2 (Task 72−35−01−440−026).

NOTE: For Stages 6, 7, and 8, the local Min. and Max. clearance variation must be within +/− 0.012 inch (+/− 0.305 mm) about the nominal clearance. You do not have to include up to five short blades in the local maximum clearance calculation as per the extended minimum radius limits as specified in 72−35−01, Assembly−03, CONFIG−2 (Task 72−35−01−440−026).

NOTE: For Stages 9 through 15, the local Min. and Max. clearance variation must be within +/− 0.005 inch (0.127 mm) about the nominal. You do not have to include up to five short blades in the local maximum clearance calculation as per the extended minimum radius limits as specified in 72−35−01, Assembly−03, CONFIG−2 (Task 72−35−01−440−026).

NOTE: One stage within the 5th through 8th stages can be up to + 0.005 inch (0.127 mm) over the maximum average and/or maximum local clearance calculation as specified in 72−35−01, Assembly−03, CONFIG−2 (Task 72−35−01−440−026).

Blade Tip Clearance And Local Limits
Table 801 (Continued)

Ref. No.	Description	Nominal Clearance	Average Clearance At Assembly		Local Limits	
			Min	Max	Min	Max

NOTE: One stage within the 9th through 12th stages can be up to + 0.005 inch (0.127 mm) over the maximum average and/or maximum local clearance calculation as specified in 72-35-01, Assembly-03, CONFIG-2 (Task 72-35-01-440-026).

NOTE: The blade tip clearance shown is for new blade and rubstrip conditions. Engines that have run will have more open clearances because the blade is permitted to cut its own trench in the abradable rubstrip.

Blade Tip Clearance And Local Limits
Table 801 (Continued)

(4) Calculate the local minimum blade tip clearance for each stage as follows:

  (a) Find the minimum rubstrip diameter.

  (b) Find the maximum rotor outside diameter.

  (c) Subtract the maximum rotor diameter from the minimum rubstrip diameter.

  (d) Divide the remainder by 2 to find the minimum local clearance.

  (e) The minimum local blade tip clearance must be within the limits shown in Table 801 for each stage.

(5) Calculate the local maximum blade tip clearance for each stage as follows:

  (a) Find the maximum rubstrip diameter.

  (b) Find the minimum rotor outside diameter.

  (c) Subtract the minimum rotor diameter from the maximum rubstrip diameter.

  (d) Divide the remainder by 2 to find the maximum local clearance.

(e) The maximum local blade tip clearance must be within the limits shown in Table 801 for each stage.

Blade Tip Clearance Inspection
Figure 801
(Task 72−35−00−990−012)

Previous Pageblock Return to Previous Menu Next Pageblock

HIGH PRESSURE COMPRESSOR (HPC) - REPAIR-01

Task 72-35-00-300-001:

1. Skim Cut Stages 8 Through 15 Rubstrips

A. Prerequisites
Do the blade tip clearance evaluation functional check inspection. See Inspection/Check-05 (Task 72-35-00-200-005).

B. Equipment And Materials Necessary

Standard Tools:
Computer Numeric Control Vertical Turret Lathe (CNC VTL)
Single Point Carboloy Or Equivalent Carbide Tool,
Tool Radius Of 0.015 - 0.031 Inch (0.38 - 0.79 mm),
With A 5 Degree Positive Side Rake

Special Tools:

PWA 76154	Adapter
PWA 86643	Sling
PWA 86668	Fixture, Machine
PWA 102179	Holder, Insert
PWA 102180	Insert, Machining
PWA 102181	Holder, Insert
PWA 102182	Holder, Insert
PWA 102183	Insert, Machining

C. General Requirements

(1) This procedure is applicable for a assembly when the minimum tip clearances are not met in 72-35-00 Inspection/Check-05 (Task 72-35-00-200-005).

D. Procedure

(1) If necessary, install the HPC stator 8th thru 14th stage stators, inner case and outer case in the PWA 86668 Machine Fixture as follows:

(a) With the front ring on a suitable working surface, place the assembled HPC rear case into the front ring of the fixture.

(b) Attach the front ring to the case with the front holding screw assembly's provided.

(c) Position the two bracket assemblies and lightly attach in place with the socket head screws.

(d) Install the rear ring to the HPC rear case. Attach with the holding screw assembly's provided.

(e) Complete the attachment of the bracket assemblies and attach with the socket head screws.

(f) Use PWA 86643 Sling and PWA 76154 Adapter to lift and position the Fixture (PWA 86668) and the HPC rear case as necessary.

NOTE: The closely controlled machined surface located on the outer section of the front and rear ring is the indicating surface for machine setup.

(2) For stages 12 through 15, set the case and Fixture (PWA 86668) assembly rear end up on a computer numeric control vertical turret lathe (CNC VTL) for machining. See Figure 901 and Table 901.

(a) Use PWA 102179 Insert Holder with PWA 102180 Machining Insert and machine with a single point carboloy or equivalent carbide tool with a tool radius of 0.015 − 0.031 inch (0.38 − 0.79 mm), a 5 degree positive side rake, a feed rate of 0.006 − 0.008 inch/revolution (0.153 − 0.203 mm/revolution), a cutting speed of 150 − 275 feet/minute (45.72 − 83.82 m/minute) and a 0.003 − 0.007 inch (0.077 − 0.177 mm) depth of cut. Do not use lubricants.

NOTE: A fresh insert should be used for each stage. Dull inserts produce a glazed surface which is unacceptable for an abradable seal.

NOTE: Lubricants will contaminate the porous metal and do not improve tool life, cutting rate or the quality of the finished surface.

Stage	Dim. A Inches (Millimeters)	Dim. B Inches (Millimeters)	Dim. C Degrees	Dim. D Inches (Millimeters)
12	8.914 (226.416)	0.820 (20.828)	4.100	9.399 (238.735)
13	6.543 (166.192)	0.715 (18.161)	3.267	6.967 (176.962)
14	4.373 (111.074)	0.708 (17.983)	1.733	4.793 (121.742)
15	2.109 (53.569)	0.999 (25.375)	−0.667	2.638 (67.005)

NOTE: Stage 15 has a negative wall angle, and no trench. Skim across the shroud parent metal.

Machine Dimensions
Table 901

(3) For Stages 8 through 11, set the case and Fixture (PWA 86668) assembly front end up on a computer numeric control vertical turret lathe (CNC VTL) for machining. See Figure 902 and Table 902.

(a) For Stage 9: use PWA 102181 Insert Holder, PWA 102182 Insert Holder and PWA 102183 Machining Insert. The clearances between the tooling and the 8th and 9th stage vanes make it necessary that the 9th stage rubstrip be machined in two cuts. Machine one half of the axial height with one holder, then machine the half that remains with the other holder to prevent damage to the vanes.

NOTE: A fresh insert should be used for each stage. Dull inserts produce a glazed surface which is unacceptable for an abradable seal.

NOTE: Lubricants will contaminate the porous metal and do not improve tool life, cutting rate or the quality of the finished surface.

(b) For Stages 8, 10 and 11: use PWA 102179 Insert Holder with PWA 102180 Machining Insert and machine with a single point carboloy or equivalent carbide tool with a tool radius of 0.015 - 0.031 inch (0.38 - 0.79 mm), a 5 degree positive side rake, a feed rate of 0.006 - 0.008 inch/revolution (0.153 - 0.203 mm/revolution), a cutting speed of 150 - 275 feet/minute (45.72 - 83.82 m/minute) and a 0.003 - 0.007 inch (0.077 - 0.177 mm) depth of cut. Do not use lubricants.

NOTE: A fresh insert should be used for each stage. Dull inserts produce a glazed surface which is unacceptable for an abradable seal.

NOTE: Lubricants will contaminate the porous metal and do not improve tool life, cutting rate or the quality of the finished surface.

Stage	Dim. E Inches (Millimeters)	Dim. B Inches (Millimeters)	Dim. C Degrees	Dim. F Inches (Millimeters)
8	1.295 (32.893)	1.260 (32.004)	5.433	1.794 (45.568)
9	4.309 (109.449)	1.033 (26.238)	3.917	4.758 (120.853)
10	7.040 (178.816)	1.018 (25.857)	3.917	7.498 (190.449)
11	9.558 (242.773)	0.851 (21.615)	4.417	9.907 (251.638)

Machine Dimensions -
Table 902

(4) Before you remove the case and stator stack from the fixture, inspect the stages that were machined on a CMM and recompute the clearances to verify compliance with the minimum local, maximum local and average clearances as specified in 72-35-00 Inspection/Check-05 (Task 72-35-00-200-005).

HIGH PRESSURE COMPRESSOR (HPC) - ASSEMBLY-01

Task 72-35-00-400-001:

1. Assemble High Pressure Compressor (HPC) (Pre-Ring Case Configuration)

A. Prerequisites

(1) Assemble axial compressor rotor assembly. See 72-35-01, Assembly-01 (Task 72-35-01-440-001).

(2) Assemble variable stator vane and HPC front case assembly. See 72-35-02, Assembly-01 (Task 72-35-02-440-001).

(3) Assemble Stages 11 and 12 compressor stator set, shroud sets, and springs (Post SB PW4ENG 72-223). See 72-35-61, Assembly-01 (Task 72-35-61-440-001).

(4) Assemble Stages 13 and 14 compressor stator set, shroud sets, and springs (Post SB PW4ENG 72-223). See 72-35-62, Assembly-01 (Task 72-35-62-440-001).

(5) Blade tip clearance evaluation. See 72-35-00, Inspection/Check-05, CONFIG-1 (Task 72-35-00-200-005).

B. Equipment And Materials Necessary

Special Tools:

	PWA 76154	Adapter (4 Necessary)
	PWA 29855-6	Pin, Aligning (3 Necessary)
	PWA 85530	Wrench
	PWA 85532	Bracket, Lift (2 Necessary)
R	PWA 85535	Nut
	PWA 85536	Adapter
	PWA 86536	Adapter
	PWA 88643	Sling (2 Necessary) (Optional To PWA 88673 And PWA 102286)
	PWA 88673	Sling (2 Necessary) (Optional To PWA 88643 And PWA 102286)
	PWA 88701	Nut, Retaining
	PWA 105181	Crimper, Mechanical (AP-5 and AP-7 Plugs)
	PWA 101980	Bracket, Lift (2 Necessary)
	PWA 102286	Adapter, Lift (Optional To PWA 88673 And PWA 88643)
R	PWA 107219	Fixture, Handling

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	2	72-35-00/22/10 or 72-35-00/22/10A
Gasket	1	72-35-00/30/300

C. Procedure

Subtask 72-35-00-430-051:

(1) Position Stage 8 compressor stator set on each half of HPC front case rear flange, bolt hole flange up. Make sure that the Stage 8 borescope port is positioned correctly at about the 4:00 o'clock location.

CAUTION: (POST SB PW4ENG 72-485) THE 5TH THROUGH 7TH STAGE (OUTER) SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED AND MACHINED AS A MATCHED SET. THESE PARTS MUST BE KEPT TOGETHER AS A SET.

(2) Attach two PWA 85532 Brackets to rear flange of stator segment and to rear flange of front case. Position brackets approximately 22 degrees from horizontal centerline. Attach hoist with standard cable sling. Lift case and stator and position onto compressor rotor fixture. Place two HPC Stage 5 shroud set locks in case halves to keep HPC Stage 5 shroud set.

(3) (Reference 1553) HPC front case axial flange bolting and torque sequence.

(a) Flange bolt hole sequencing starts at front end (down position). "L" Refers to left axial flange of "lower" case. "R" Refers to right axial flange of "lower" case viewed from rear.

(b) Secure case with minimum of three bolts, threads lubricated with Engine Oil P03-001, per half segment, two bolts at upper and lower end and one bolt approximate center. Bolts are installed with the heads to the upper case. Install axial flange bolts, threads lubricated with Engine Oil P03-001 and nuts fingertight, 11 places, both sides.

(c) Using PWA 86536 Adapter torque axial flange bolts to 565 - 595 lb-in. (63.836 - 67.226 N.m). Starting with hole 1L, torque to following sequence: 1L, 1R, 2L, 2R, 3L, 3R, continue sequence to rear flange.

(4) Rotate Stage 8 stator set so that split centerline is approximately 90 degrees from front case bolts and nuts.

(5) If stators have featherseal slots, install featherseals. If stator slots are welded shut (SB PW4ENG 72-142), do not try to install featherseals. Secure set together with eight bolts, threads lubricated with Engine Oil P03-001, heads to left, and nuts. Tighten and torque nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

Subtask 72-35-00-430-052:

(6) Install Stages 9 and 10 stator set to rest on Stage 8 stator with case split centerline at 1:30 and 7:30 o'clock locations. If stators have featherseal slots, install featherseals. If stator slots are welded shut (SB PW4ENG 72-142), do not try to install featherseals. Secure set together with 10 bolts, threads lubricated with Engine Oil P03-001, heads to left and nuts fingertight. Tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Make sure that the Stage 10 borescope port is positioned correctly at about the 7:00 o'clock location.

(7) Secure Stage 8 with Stages 9 and 10 with 40 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Subtask 72−35−00−430−053:

CAUTION: THE 11TH AND 12TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72−396) MUST BE USED WITH THE 12TH AND 13TH STAGE ALUMINUM OXIDE COATED BLADE TIPS (SB PW4ENG 72−395).

(8) Raise rotor approximately 0.150 inch (3.810 mm) to allow Stages 11 and 12 stator set to be installed within Stages 9 and 10.

(9) Install one quarter section in 9th and 10th stage. Install a long seal in vertical groove in one end. Install second quarter section and butt against previously installed quarter and seal. Complete assembly of stators until all four sections are installed.

(10) Align splits in Stages 11 and 12 to be 45 degrees on either side of 6 o'clock location. Also align bolts holes with Stages 9 and 10. Make sure that the Stage 12 borescope port is positioned correctly at about the 3:00 o'clock location.

CAUTION: THE 13TH AND 14TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72−396) MUST BE USED WITH THE 14TH AND 15TH STAGE ALUMINUM OXIDE COATED BLADE TIPS (SB PW4ENG 72−395) AND THE MORE WEAR RESISTANT ANTI−ROTATION SLOTS, REAR INNER CASE (SB PW4ENG 72−403).

(11) Lower rotor assembly to previous height. Install Stages 13 and 14 stator aligning quadrants with previous stage installed. Install four long seals at each of four quadrant ends. Make sure that the Stage 14 borescope port is positioned correctly at about the 2:30 o'clock location.

(12) Install two sets of four seals at the 12th and 13th stage junction. Install another set of four seals at the 15th stage rubstrip location.

CAUTION: THE HPC REAR INNER CASE WITH THE MORE WEAR RESISTANT ANTI-ROTATION SLOTS (SB PW4ENG 72-403) MUST BE USED WITH THE 13TH AND 14TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72-396).

(13) Install HPC inner rear case over rear stators.

(a) Install two PWA 101980 Lifting Brackets 180 degrees apart on inner rear case rear flange. Attach PWA 88643 or PWA 88673 Sling to the lifting brackets and lower the inner rear case over the HPC rear stators.

(b) Carefully drift to seat on 10th stage flange after aligning holes in case with stator holes. Install eight bolts, threads lubricated with Engine Oil P03-001, equally spaced to secure case and stators. Tighten bolts to draw flanges together. After drawing flanges together remove bolts.

(c) Remove the two PWA 101980 Lifting Brackets from the inner rear case rear flange.

CAUTION: THIRTEENTH AND FOURTEENTH STAGE STATOR SET MUST BE USED IN SETS WITH THRUST PIN COVERS AND INNER REAR CASE ASSEMBLY (SB PW4ENG 72-229).

(14) Install eight HPC thrust pin covers as follows:

(a) (Reference 2126) For engines with axial thrust pins (Pre SB PW4ENG 72-229) use phenolic (or equivalent) guides to align both pin locations of each stator segment. After positioning with guides, remove guide from one location and install pin. After installing first pin, remove second guide and install pin at that location. Repeat procedure for all segments. Pin should not rotate freely when tight to case prior to bolting. Use only reasonable force to install pin to the case.

NOTE: The eight thrust pin covers will be secured, with 16 thrust pin cover bolts, after installation of the HPC outer rear case.

(b) For engines without axial thrust pins (Post SB PW4ENG 72-229), install the thrust pin covers.

NOTE: The eight thrust pin covers will be secured, with 16 thrust pin cover bolts, after installation of the HPC outer rear case.

Subtask 72-35-00-430-054:

(15) Install gaskets to locations in Stage 9 stator. Install packing material into each half of front case rear flange. Packing material must be flush or below case split line. Install either PWA 88673 or PWA 88643 Sling or PWA 102286 Lift Adapter to HPC outer rear case. Using hoist attached to sling or lift adapter, raise outer rear case over rotor. Install three PWA 29855-6 Aligning Pins equally spaced to stator flange stator 10 and 11. Lower outer rear case engaging pins and front case flange.

NOTE: Packings/gaskets are installed at HPC Flanges E, H, and K to reduce air leakage at those locations. The front and rear flanges of the HPC front case set have been modified to incorporate a packing groove. The rear flange of the HPC rear case assembly has been modified to incorporate a gasket groove. Because the modified flanges can be installed with or without seals, the case sets and case assemblies (Pre and Post SB PW4ENG 72-48) are interchangeable however, the packings and gaskets must only be used with the new or modified case sets and case assemblies.

Subtask 72-35-00-430-075:

(16) Secure thrust pins or thrust pin covers, as applicable, to the HPC inner rear case with 16 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

HIGH PRESSURE COMPRESSOR (HPC) - ASSEMBLY-01

CAUTION: (PRE AND POST SB PW4ENG 72-366) RUNNER AND SHIM ARE INTERCHANGEABLE IN SETS. HOWEVER, SHIM (POST SB PW4ENG 72-366) MAY BE USED WITH RUNNER (PRE SB PW4ENG 72-366).

(17) Install 11 runners to upper Flange H. Secure runners with shims using bolts, threads lubricated with Engine Oil P03-001, and nuts. Tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(18) Install the Flange H hardware as follows. Refer to 72-35-00, Assembly-21 (Task 72-35-00-430-021).

(19) Install four bolts, threads lubricated with Engine Oil P03-001, equally spaced around stator flange and draw stators up to outer rear case. Remove pins and install remaining 60 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(20) Install HPC rotor and stator identification plate to bracket on HPC rear case Flange J at approximately 2 o'clock location. Secure with bolts, threads lubricated with Engine Oil P03-001, heads outward, and nuts. Tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Subtask 72-35-00-430-055:

CAUTION: THE INSTALLATION OF PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD IS OPTIONAL WITH PN 50J685 COMPRESSOR STATOR EXIT ASSEMBLY.

CAUTION: PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD CANNOT BE INSTALLED WITH PN 51J285-01, PN 51J385-01 OR PN 51J685-01 COMPRESSOR STATOR EXIT ASSEMBLY.

CAUTION: USE PN MS9723-05 BOLTS WITH EXIT GUIDE VANE SUPPORT, HEAT SHIELD AND 50H953 HPC REAR SUPPORT (PRE SB PW4ENG 72-234).

CAUTION: USE PN MS9696-06 BOLTS WITHOUT THE SUPPORT AND HEAT SHIELD AND WITH 50H953 HPC REAR

SUPPORT (POST SB PW4ENG 72-234, PRE SB PW4ENG 72-298).

CAUTION: USE PN MS9723-04 BOLTS WITHOUT THE EXIT GUIDE VANE SUPPORT, HEAT SHIELD AND WITH 51H530 REAR SUPPORT (POST SB PW4ENG 72-298).

(21) Install HPC rear support on 14th stator flange and outer rear case aligning holes in support with holes in inner rear case. Install heat shield to rest on inner rear case flange.

(22) Install exit guide vane support over heat shield and rear support aligning bolt holes. Secure rear support to inner rear case with 62 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(23) For post SB PW4ENG 72-229 rotor stator assembly only: Check dimensional constraints as shown on Figure 1002 to make sure stator installation is correct.

Subtask 72-35-00-430-056:

R (24) Attach hoist to PWA 107219 Fixture and raise fixture over rear hub of rotor. Lower fixture to HPC rear case. Secure fixture to case.

(25) FOR THESE MODELS: 4152, 4156A, 4158
R Install the PWA 85535 Nut over rear end of HPC rear hub. Position PWA 85530 Wrench over nut and engage drive teeth in nut. Insert PWA 85536 Adapter into rear end of HPC rear hub. Torque nut to 300 lb-in. (33.895 N.m).

(26) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R (Pre SB PW4ENG 72-562) Attach the hoist to the PWA 107219 Fixture and raise the fixture over the rear shaft of the rotor. Lower the fixture to the HPC rear case. Tighten the fixture to the case. Install the PWA 85535 Nut over the rear end of the HPC rear shaft. Install the PWA 85530 Wrench over the nut and engage the drive teeth in the nut. Put the PWA 85536 Adapter into the rear end of the HPC rear shaft. Torque the nut to 300 lb-in. (33.895 N.m).

(27) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R (Post SB PW4ENG 72−562) Attach the hoist to the PWA
R 107219 Fixture and raise the fixture over the rear shaft of the rotor. Lower the fixture to the HPC rear case. Tighten the fixture to the case. Install the PWA 88701 Nut over the rear end of the HPC rear shaft. Install the PWA 85530 Wrench over the nut and engage the drive teeth in the nut. Put the PWA 85536 Adapter into the rear end of the HPC rear shaft. Torque the nut to 300 lb−in. (33.895 N.m).

R (28) Attach PWA 88643 or PWA 88673 Sling to hoist. Attach sling with two PWA 76154 Adapters to fixture on rear case and raise rotor from stand. Install second hoist and PWA 88643 or PWA 88673 Sling with two PWA 76154 Adapters to front fixture and trunnion rotor to front end up. Lower rotor to build stand and remove sling, hoist, and adapters.

Subtask 72−35−00−430−057:

R (29) (Reference 1557) (Pre SB PW4ENG 72−675) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06−054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03−001. Install plug into lower half of Stages 9 and 10 stator through rear case at approximately 5 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 − 190 lb−in. (19.8 − 21.5 N.m). See Figure 1002.

CAUTION: DO NOT APPLY ANTISEIZE PASTE P06−054 TO THE THREADS AND WASHER FACE OF THE POST SB PW4ENG 72−675 PLUGS. THESE PLUGS HAVE BAKED ON ANTIGALLANT COMPOUND.

R (30) (Reference 1557) (Post SB PW4ENG 72−675) Install plug into lower half of Stages 9 and 10 stator through rear case at approximately 5 o'clock location. Do not use Antiseize Paste P06−054 or Engine Oil P03−001. Run plug in to be sure plug is seated. Tighten and torque plug to 175 − 190 lb−in. (19.8 − 21.5 N.m). See Figure 1003.

R (31) (Reference 1559) (Pre SB PW4ENG 72-675) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug into Stage 14 stator through rear case at approximately 9:30 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

CAUTION: DO NOT APPLY ANTISEIZE PASTE P06-054 TO THE THREADS AND WASHER FACE OF THE POST SB PW4ENG 72-675 PLUGS. THESE PLUGS HAVE BAKED ON ANTIGALLANT COMPOUND.

R (32) (Reference 1559) (Post SB PW4ENG 72-675) Install plug into Stage 14 stator through rear case at approximately 9:30 o'clock location. Do not use Antiseize Paste P06-054 or Engine Oil P03-001. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

R (33) (Reference 1556) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug into rear case boss adjacent to Flange H at approximately 7:30 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

CAUTION: IT IS VERY IMPORTANT TO OBEY THE PROCEDURES IN THE STANDARD PRACTICES MANUAL, PN 585005 70-53, LOCKING DEVICES, WHEN YOU INSTALL (BORESCOPE) PLUG KEY WASHERS. INCORRECT INSTALLATION OF THE KEY WASHERS CAN CAUSE THE (BORESCOPE) PLUGS TO COME OUT. IF A (BORESCOPE) PLUG IS NOT THERE, HOT GASES FROM THE PLUG OPENING CAN CAUSE DAMAGE TO THE THRUST REVERSER.

R (34) (Reference 1555) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug and washer into rear case boss above previously installed plug at approximately 5 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in.

(19.8 - 21.5 N.m). (Pre SB PW4ENG 72-708) After you torque the borescope plug, bend the tabs of the key washer by the instructions in Chapter/Section 70-53 of the Standard Practices Manual, PN 585005.

(a) (Post SB PW4ENG 72-708) (AP-5 and AP-7): Install the plugs into the compressor case. Do not use Antiseize Paste P06-054 or Engine Oil P03-001. Run in the borescope plug to be sure the plug is seated. Tighten and torque the plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). After you torque the borescope plug, use the PWA 105181 Mechanical Crimper to bend the tabs of the key washer as follows:

1 Put the end of the crimper onto the end of the plug. Turn the crimper so the jaw is under a key washer tab.

2 Squeeze the crimper handle to bend the key washer tab until the tab makes contact with the hex head of the plug.

3 Release the handle and reposition the jaw so that it makes contact again at the base of the tab.

4 Squeeze the crimper handle to final bend the key washer tab until the tab makes contact with the hex head of the plug and maintains less than a 0.020 inch (0.508 mm) gap everywhere between the tab and the hex head of the plug.

5 Crimp all five (5) of the key washer tabs by the same method.

6 All tabs of the key washer must be bent, examine the tabs for the following conditions:

NOTE: Key washer PN 58H216 uses five tabs as an alternative to two. These additional tabs permit some deviation from the Standard Practices Manual, PN 585005 requirements but it is necessary that all five tabs meet these relaxed requirements. The variations to the Standard Practices Manual, PN 585005 procedure for this key washer are as follows:

a All five tabs must be within 0.020 inch (0.508 mm) maximum of the hex head of the plug. If a tab overlaps two different faces of the hex head the 0.020 inch (0.508 mm) gap requirement must be kept between the tab and which ever face of the hex head has the larger surface area coverage with the tab. It is a good practice to bend the tab against the remaining face.

b It is not necessary that 75 percent of the base of the tab make contact with the hex head of the plug.

c It is not necessary that the key washer tabs be pulled away from the axis of the plug before you torque the plug. This requirement, as stated in the Standard Practices Manual, PN 585005 is meant for key washers that have fewer tabs.

R (35) (Reference 1556) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug into rear case boss above previously installed plug at approximately 8:30 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

CAUTION: IT IS VERY IMPORTANT TO OBEY THE PROCEDURES IN THE STANDARD PRACTICES MANUAL, PN 585005 70-53, LOCKING DEVICES, WHEN YOU INSTALL (BORESCOPE) PLUG KEY WASHERS. INCORRECT INSTALLATION OF THE KEY WASHERS CAN CAUSE THE (BORESCOPE) PLUGS TO COME OUT. IF A (BORESCOPE) PLUG IS NOT THERE, HOT GASES FROM THE PLUG OPENING CAN CAUSE DAMAGE TO THE THRUST REVERSER.

R (36) (Reference 1555) Remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug and washer into rear case boss above previously installed plug at approximately 9:30 o'clock location. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in.

(19.8 - 21.5 N.m). (Pre SB PW4ENG 72-708) After you torque the borescope plug, bend the tabs of the key washer by the instructions in Chapter/Section 70-53 of the Standard Practices Manual, PN 585005.

(a) (Post SB PW4ENG 72-708) (AP-5 and AP-7): Install the plugs into the compressor case. Do not use Antiseize Paste P06-054 or Engine Oil P03-001. Run in the borescope plug to be sure the plug is seated. Tighten and torque the plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). After you torque the borescope plug, use the PWA 105181 Mechanical Crimper to bend the tabs of the key washer as follows:

1 Put the end of the crimper onto the end of the plug. Turn the crimper so the jaw is under a key washer tab.

2 Squeeze the crimper handle to bend the key washer tab until the tab makes contact with the hex head of the plug.

3 Release the handle and reposition the jaw so that it makes contact again at the base of the tab.

4 Squeeze the crimper handle to final bend the key washer tab until the tab makes contact with the hex head of the plug and maintains less than a 0.020 inch (0.508 mm) gap everywhere between the tab and the hex head of the plug.

5 Crimp all five (5) of the key washer tabs by the same method.

6 All tabs of the tab washer must be bent, examine the tabs for the following conditions:

NOTE: Tab washer PN 58H216 uses five tabs as an alternative to two. These additional tabs permit some deviation from the Standard Practices Manual, PN 585005 requirements but it is necessary that all five tabs meet these relaxed requirements. The variations to the Standard Practices Manual, PN 585005 procedure for this tab washer are as follows:

a All five tabs must be within 0.020 inch (0.508 mm) maximum of the hex head of the plug. If a tab overlaps two different faces of the hex head the 0.020 inch (0.508 mm) gap requirement must be kept between the tab and which ever face of the hex head has the larger surface area coverage with the tab. It is a good practice to bend the tab against the remaining face.

b It is not necessary that 75 percent of the base of the tab make contact with the hex head of the plug.

c It is not necessary that the tab washer tabs be pulled away from the axis of the plug before you torque the plug. This requirement, as stated in the Standard Practices Manual, PN 585005 is meant for washers that have fewer tabs.

R (37) (Pre SB PW4ENG 72-583) Install gasket to cover and install cover to HPC rear case at approximately 2:30 o'clock position. Secure cover with six non rust-proof bolts, threads lubricated with Engine Oil P03-001, and torque to 85 - 95 lb-in. (9.604 - 10.734 N.m), then without loosening, retorque to required torque until torque is maintained. See Figure 1003.

R (38) (Post SB PW4ENG 72-583) Install gasket to cover and install cover to HPC rear case at approximately 2:30 o'clock position. Secure cover with six rust-proof bolts, threads lubricated with Engine Oil P03-001, and torque to 85 - 95 lb-in. (9.604 - 10.734 N.m), then without loosening, retorque to required torque until torque is maintained. See Figure 1004.

D. Postrequisites

(1) Install synchronizing rings and determine runner clearances. See Assembly-02 (Task 72-35-00-400-002).

HIGH PRESSURE COMPRESSOR (HPC) - ASSEMBLY-01

Task 72-35-00-400-007:

1. Assemble High Pressure Compressor (HPC) (Post SB PW4ENG 72-756 And SB PW4ENG 72-759)

A. Prerequisites

(1) Refer to 72-35-00, Inspection/Check-04, CONFIG-2 (Task 72-35-00-990-010) or CONFIG-4 (Task 72-35-00-990-011) as applicable for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble and balance the HPC rotor assembly. Refer to 72-35-01, Assembly-01 through Assembly-16.

(3) Assemble variable stator vane and HPC front case assembly. Refer to 72-35-02, Assembly-01 (Task 72-35-02-440-001).

(4) Assemble Stages 8 through 14 compressor stator vane sets. Refer to 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(5) Assemble, machine, and disassemble the HPC outer air seal set. Refer to 72-35-04, Assembly-01 (Task 72-35-04-440-001), Assembly-02 (Task 72-35-04-440-002), and Disassemby-01 (Task 72-35-04-040-001) respectively.

(6) Blade tip clearance evaluation. Refer to 72-35-00, Inspection/Check-05, CONFIG-2 (Task 72-35-00-990-012).

B. Equipment And Materials Necessary

Standard Tools:

Optional, Wrench (Extended Socket) Part No. QCL 5/16-2D-3/16 Used With Optional Cleco Air Gun	Brimatco Corporation P.O. Box 88 1486 Highland Ave. Cheshire, CT 06410 USA
Optional Cleco Air Gun (Nutrunner) PN 44RNAL-2-H-3, or PN 44RNAL-2RA8	Local Distributor Or, Cooper Tools Sales and Service P.O. Box 1410 Lexington, SC 29071-1410

Standard Tools:

(CONTINUED)

Or Equivalent	USA

Optional,	
Flexible Extension	Snap−On Technologies Inc.
Part No.	P.O. Box 1430
GSYMU101	Kenosha, WI 53141−1430
Or Equivalent	USA

NOTE: The optional Brimatco wrench (extended socket) PN QCL 5/16−2D−3/16 can be use with the Cleco Air Gun to help install the flange nuts on the 8th through 14th stage compressor cases.

Special Tools:

	PWA 76154	Adapter (4 Necessary)
	PWA 85530	Wrench, Torque
	PWA 85532	Bracket, Lift (2 Necessary) (Front Split Case)
	PWA 85535	Nut
	PWA 86536	Adapter, Torque (HPC Front Case, Split Flange)
	PWA 87485	Gage, Indicating (Concentricity Check)
	PWA 88643	Sling (2 Necessary) (Optional To PWA 88673)
	PWA 88673	Sling (2 Necessary)
	PWA 88701	Nut, Retaining
	PWA 100357	Guide, Aligning(8th Through 14th Stage Anti−Rotation Lug Installation)
	PWA 100379	Pin, Alignment (2 Necessary) (12th Stage Compressor Air Seal Installation)
	PWA 100383	Adapter, Torque (12th Stage Case Installation)
	PWA 102260	Adapter, Torque (9th Through 14th Stage Compressor Case Flange Nuts)
	PWA 105181	Crimper, Mechanical (AP−5 And AP−7 Plugs)
R	PWA 105504	Adapter, Lift (HPC Rear Case)
	PWA 105506	Ring, Constraint (Concentricity Check)
	PWA 105609	Pin, Alignment (2 Necessary) (HPC Rear Case Installation)
	PWA 105768	Spacer, Positioning (40 Necessary)
R	PWA 107219	Fixture, Handling (HPC Rear)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-341	Tape, Plastic (Yellow) (PMC 4134)
P05-395	Beeswax
P05-396	Paraffin Wax Blend
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

See The Applicable Illustrated Parts Catalog For Specific Part Usage.

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	1	72-35-00/018A/150A
Key Washer	2	72-35-00/022/020

C. Procedure

NOTE: The HPC air seal set (Stages 5 through 15) (called seal set), referred to in the following procedure, consists of the HPC front case set, 5th through 7th stage HPC shroud sets, 8th through 15th stage compressor air seal assemblies, 8th through 14th stage compressor case assemblies, HPC rear support, and the HPC rear case. The matched set detail parts are identified by the Letter M followed by the last five digits of the HPC rear case serial number.

NOTE: The HPC rotor assembly is front end down on PWA 87022 Build and Storage Stand. A PWA 88560 Handling Fixture is installed on the HPC front hub. See Figure 1002 (Sheet 1).

Subtask 72-35-00-430-114:

(1) Install anti-rotation lugs in the 8th through 14th stage compressor cases. See Figure 1001 (Sheets 1 and 2).

(a) Install anti-rotation lugs in the 8th stage case as follows.

1 Put the 8th stage case on the workbench, front end down.

NOTE: The each case has a reference line on the OD of the rear flange.

2 Apply Engine Oil P03-001 to the 12 anti-rotation lugs (1001/1).

3 Install the anti-rotation lugs (1001/1) through the holes in the side of the case, lug on the ID and longer sides in the vertical position. Install washers (1001/2) and nuts (1001/3).

NOTE: For the 8th and 12th stages, install the anti-rotation lugs with the longer leg of the lug down,

4 Put the PWA 100537 Guide on the workbench inside the case. See Figure 1001 (Sheet 2).

5 Use the correct guide side, and move the guide to engage the head of the anti-rotation bolt.

6 Use the Guide to hold the anti-rotation lug in the vertical position while you tighten and torque the nuts (1001/2) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

7 Repeat the above steps to install the remaining anti-rotation lugs in the 8th stage case.

(b) Repeat the above steps to install the anti-rotation lugs in the 9th through 14th stage cases as shown in Figure 1001 (Sheet 1).

Subtask 72-35-00-430-097:

(2) Install the HPC front case and variable vane assembly. See Figure 1002 (Sheets 1 and 2).

(a) Attach two PWA 85532 Brackets to the rear flange of the "LOWER" HPC front case segment. Put four cap screws for each bracket in holes 9 through 13 of the rear flange split case half.

(b) Use a hoist to attach a PWA 88673 Sling to the Brackets.

(c) Make sure that the locks are seated fully on the 5th stage shroud segments at the vertical flanges of the HPC front case segments.

(d) Make sure that the upper vanes (7th stage) are in a closed (flat) position. Close the vanes if necessary.

CAUTION: USE CARE AS YOU INSTALL THE CASE AND VANE ASSEMBLY TO AVOID DAMAGE TO THE KNIFE EDGES, AIR SEALS, AND BLADE TIPS OF THE DRUM ASSEMBLY.

(e) Use the hoist to carefully align the vanes between the blades and install the "LOWER" HPC front case and vane assembly on the build stand, with the center of the case at the elongated slots position, and the end flanges of the case at the trunnion spool positions.

NOTE: The HPC front cases are marked "UPPER" and "LOWER" on the outer edge of the vertical (split) flanges of the cases.

(f) Align the boltholes in the front case with the boltholes in the fixture.

(g) Remove the hoist, sling, and brackets.

(h) Assemble the case segment to the fixture with a minimum of three bolts (one at each end and one at the approximate center). Install the bolts (boltheads up), washers (under boltheads), and nuts. Tighten the bolts fingertight.

(i) Attach two PWA 85532 Brackets to the rear flange of the "UPPER" HPC front case segment. Put four cap screws for each bracket in holes 9 through 13 of the rear flange split case half.

(j) Use a hoist to attach the PWA 88673 Sling to the Brackets.

(k) Use the host, carefully install the "UPPER" HPC front case and vane assembly on the build stand. Remove the hoist, sling, and brackets.

(l) (Reference 1580) Assemble the case segment to the Fixture with a minimum of three bolts (one at each end and one at the approximate center). Install the bolts (boltheads up), threads lubricated with Engine Oil P03-001, washers (under boltheads), and nuts. Tighten the bolts fingertight.

(m) Tighten the bolts fingertight.

(n) (Reference 1553) Assemble the two halves of the HPC front case set. See Figure 1002 (Sheet 2).

1 Install 22 bolts, bolt heads against the flange of the case marked "UPPER", and nuts to the vertical flanges of the case halves. Tighten the bolts fingertight.

NOTE: Figure 1002 (Sheet 2) shows the preferred bolt position. The bolts can be installed in a different direction if necessary.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

2 Use PWA 86536 Adapter to torque the axial flange bolts to 565 - 595 lb-in. (63.836 - 67.226 N.m) in the following sequence.

3 Start at Hole 1L and torque the bolts in the following sequence: 1L, 1R, 2L, 2R, 3L, 3R, 4L, 4R, 5L, 5R, 6L, 6R, 7L, 7R, 8L, 8R, 9L, 9R, 10L, 10R, 11L, 11R.

NOTE: The flange bolthole sequence starts at the middle as shown. The Letter L refers to the left axial flange. The Letter R refers to the right axial flange, aft, looking forward.

4 Make sure that each axial flange is properly seated.

a A gap of 0.005 inch (0.127 mm) is permitted provided that the gap does not extend through the flange.

(o) Install the remaining Fixture detail bolts (boltheads up), threads lubricated with Engine Oil P03-001, and washers under the bolthead through the case flange and into the Fixture. Assemble the nuts to install the case.

(p) Use an alternating pattern to tighten and torque the nuts that attach the case to the support to 250 - 270 lb-in. (28.246 - 30.506 N.m).

Subtask 72-35-00-430-098:

(3) Install the 8th stage air seal assembly. See Figure 1003, (Sheet 1 or 2) as applicable.

(a) Make sure that the air seal (1003/1) has the correct seal set mating number.

(b) Install the air seal (shorter leg of rubstrip down) on the rear flange of the HPC front case.

(c) Align the boltholes in the outer flange of the air seal with the boltholes in the HPC front case rear flange, with the offset bolt in the inner bolthole pattern, at approximately the 12 o'clock position.

NOTE: The 8th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(d) Install a minimum of 40 PWA 105768 Spacers, equally spaced, between the 8th stage air seal and the rear flange of the HPC front case.

NOTE: Install the spacers so that the tab with the ring and red flag is up and above the synchronizing ring.

(4) Make marks to show the location of the anti-rotation lugs of the 8th stage compressor case on the 8th stage air seal. See Figure 1004.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 8th stage compressor case, bolts in the rear flange up, on the 8th stage compressor air seal. Align the offset hole in the front flange with the offset hole in the 8th stage air seal.

NOTE: The 8th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti−rotation lugs in the ID of the 8th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 8th stage air seal.

(d) Remove the 8th stage compressor case.

(5) Install the 8th stage HPC stator (vane) segments. See Figure 1005 (Sheet 1).

(a) Obtain the twelve 8th stage HPC stator (vane) segments. See 72−35−00, Assembly−06 (Task 72−35−00−430−006).

(b) Make sure that the sealant cure time is completed.

(c) Install the stator (vane) segments to the air seal assembly as follows:

1 If necessary, you can use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments with the thicker seal land down and away from the assembler, with the concave side of the airfoil to the assemblers right.

3 Align the anti−rotation lug slots in the stator (vane) segments with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife−edges of the drum rotor.

(d) Install a nine stator (vane) segment to the air seal assembly as specified above at approximately the top (12 o'clock) position. Align the left vane anti−rotation lug slot with the reference ink mark on the air seal on the assemblers left.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining stator (vane) segments in the following sequence:
Two eight stator (vane) segments
One nine stator (vane) segment
Two eight stator (vane) segments
One nine stator (vane) segment
Two eight stator (vane) segments
One nine stator (vane) segment
Two eight stator (vane) segments

(6) (Reference 1580) Install the 8th stage compressor case (1006/1). See Figure 1006 (Sheet 1 or 2) as applicable.

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 8TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE−EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife−edge seal and that the vanes can move.

(c) Install the case, rear flange with bolts up, over the 8th stage vanes. Align the offset hole in the front flange of the case with the offset bolt in the 8th stage air seal (at approximately the 12 o'clock position). Align the anti−rotation lugs in the case with the slots in the stator (vane) segments.

NOTE: The 8th stage case rear flange OD has a reference line at the approximate 12 o'clock position. The 8th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Tape P05−341 to the OD of the case to cover all through holes.

(f) For the symmetric case configuration, apply Engine Oil P03−001 to the 64 nuts (1006/2). See Figure 1006 (Sheet 1).

(g) For the symmetric case configuration, install 16 lubricated nuts (1006/2), eight pairs equally spaced, and thick washers (1006/3) (under the nuts), to the bolts through the front flange of the 8th stage case.

NOTE: You can use a flexible extension (such as a Snap−On GSYMU101) to install the nuts.

(h) For the asymmetric case configuration, apply Engine Oil P03−001 to the 64 bolts (1006/2). See Figure 1006 (Sheet 2).

(i) For the asymmetric case configuration, install 16 lubricated bolts (1006/2), eight pairs equally spaced, and thick washers (1006/3) (under the bolts), through the front flange of the 8th stage case.

(j) Tighten and torque 16 nuts or bolts (as applicable) total, eight pairs at Location R, in the special sequence shown in Figure 1007 to 140 − 150 lb−in. (15.818 − 16.948 N.m).

NOTE: You can use a flexible extension (such as a Snap−On GSYMU101) to install the nuts.

(k) For the symmetric case configuration, install the remaining lubricated nuts (1006/2) and thick washers (1006/3) for a total of 64 nuts and thick washers. See Figure 1006 (Sheet 1).

(l) For the asymmetric case configuration, install the remaining lubricated nuts (1006/2) and thick washers (1006/3) for a total of 64 nuts and thick washers. See Figure 1006 (Sheet 2).

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(m) Use an alternating pattern (180 degrees apart) to tighten and torque the remaining nuts or bolts as applicable to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

Subtask 72−35−00−430−099:

(7) Install the 9th stage compressor air seal assembly. See Figure 1008.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 9th stage air seal, longer leg of air seal down, onto the 8th stage compressor case. Align the offset hole of the air seal with the offset hole in the rear flange of the 8th stage case at approximately the 12 o'clock position.

NOTE: The 9th stage air seal flange OD has a reference mark line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(f) Install a minimum of 30 lubricated work bolts (boltheads down), washers, and nuts equally spaced to into the 9th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(h) Remove the work bolts, washers, and nuts.

(i) Remove the protective cover from the blades.

(8) Make marks to show the location of the anti−rotation lugs of the 9th stage compressor case on the 9th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 9th stage compressor case, bolts in the rear flange up, on the 9th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 9th stage air seal.

NOTE: The 9th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti−rotation lugs in the ID of the 9th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 9th stage air seal.

(d) Remove the 9th stage compressor case.

(9) Install the 9th stage HPC stator (vane) segments. See Figure 1009.

(a) Obtain the 9th stage HPC stator (vane) segments.

(b) Install the stator (vane) segments to the air seal assembly as follows:

1 If necessary, you can use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments with the seal land down and away from the assembler.

3 Align the anti−rotation lug slots in the stator (vane) segments with the reference ink marks on the compressor air seal.

4 Make sure that the vanes do not touch the knife−edges of the drum rotor.

(c) Install the stator (vane) segments that follow to the air seal assembly, with the concave side of the vane airfoil to the assemblers right.

(d) Install a five vane stator segment to the air seal assembly as specified above at approximately the top (12 o'clock) position.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining 23 stator (vane) segments as shown in Figure 1009.

NOTE: The two special four vane stator segments (1009/2) can be located at any four vane location. The special five vane stator segments (1009/3) can be located at any five vane location.

(10) (Reference 1580) Install the 9th stage compressor case assembly. See Figure 1010, (Sheet 1).

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 9TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE−EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife edge seal and that the vanes can move.

(c) Install the case, rear flange with bolts up, over the 9th stage vanes on the 9th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 9th stage air seal, and the anti−rotation lugs in the case with mating slots in the stator (vane) segments.

NOTE: The 9th stage case rear flange OD has a reference mark line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Tape P05−341 to the OD of the case to cover all through holes.

(f) Apply Engine Oil P03−001 to the 12 nuts (1010/2) you will install on the dowel bolts in the following step.

(g) Install the 12 lubricated nuts (1010/2) and washers (1010/3) onto the dowel bolts in the front flange of the 9th stage case. See Figure 1010 (Sheet 2).

(h) Apply Engine Oil P03−001 to the 60 bolts (1010/4).

(i) Install 16 lubricated bolts (1010/4) (boltheads down), washers, and nuts, eight pairs equally spaced to the boltholes in the front flange of the 9th stage case. See Figure 1007.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(j) Tighten and torque the 16 bolts, eight pairs at Location R, in the sequence shown in Figure 1007 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten bolts until no loss of torque occurs.

NOTE: You can use the PWA 102260 Adapter to torque the flange nuts for all stages.

(k) Install the remaining lubricated bolts (boltheads down), and nuts in the flange boltholes except at bolthole Locations AJ. See Figure 1010 (Sheet 3).

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(l) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

Subtask 72-35-00-430-100:

(11) Install the 10th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 10th stage air seal, longer leg of the air seal down, on the 9th stage case. Align the offset hole in the air seal, at the approximate 12 o'clock position, with the offset hole in the rear flange of the 9th stage case.

NOTE: The 10th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03-001 to a minimum of 30 work bolts.

(f) Install a minimum of 30 lubricated work bolts (boltheads down), washers, and nuts equally spaced into the 10th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(h) Remove the work bolts, washers, and nuts.

(i) Remove the protective cover from the blades.

(12) Make marks to show the location of the anti-rotation lugs of the 10th stage compressor case on the 10th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 10th stage compressor case, bolts in the rear flange up, on the 10th stage air seal. Align the offset hole in the front flange with the offset hole in the 10th stage air seal.

NOTE: The 10th stage compressor case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti-rotation lugs in the ID of the 10th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 10th stage air seal.

(d) Remove the 10th stage compressor case.

(13) Install the 10th stage HPC stator (vane) segments. See Figure 1011.

(a) Obtain the twelve 10th stage HPC stator (vane) segments. See 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(b) Make sure that the sealant cure time is completed.

(c) Locate the stator (vane) segment with the borescope hole and put it aside.

(d) Install the stator (vane) segments to the air seal assembly as follows:

1 If necessary, you can use Beeswax P05-395 or Paraffin Wax Blend P05-396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments with the thicker seal land down and away from the assembler.

3 Align the anti-rotation lug slot in the stator (vane) segment with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife-edges of the drum rotor.

(e) Install a stator (vane) segment to the air seal assembly as specified above at approximately the top (12 o'clock) position. Align the left vane anti-rotation lug slot with the reference ink mark on the air seal on the assemblers left.

(f) Continue to the assemblers right, use the procedure as specified above and install four additional stator (vane) segments.

(g) Continue to the assemblers right, use the procedure as specified above and install the stator (vane) segment with the borescope vane adjacent to the previously installed stator (vane) segments.

(h) Continue to the assemblers right, use the procedure as specified above and install the remaining stator (vane) segments adjacent to the previously installed stator (vane) segments.

(14) (Reference 1580) Install the 10th stage compressor case assembly onto the 10th stage air seal. See Figure 1012.

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 10TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE−EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife edge seal and that the vanes can move.

(c) Install the case, rear flange with bolts up, over the 10th stage vanes on the 10th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 10th stage air seal, and the anti−rotation lugs in the case with mating slots in the stator (vane) segments.

NOTE: The 10th stage case rear flange OD has a reference mark line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Engine Oil P03−001 to the 12 nuts you will install onto the dowel bolts in the next step.

(f) Install the 12 lubricated nuts and 24 washers (two under each nut) to the dowel bolts in the front flange of the 10th stage case.

(g) Apply Engine Oil P03−001 to the 71 bolts (1012/4).

(h) Install 16 lubricated bolts (1012/4) (boltheads down), washers (1012/3) (two under each nut), and nuts (1012/2) eight pairs equally spaced to the boltholes in the front flange of 10th stage case.

(i) Tighten and torque the 16 bolts, eight pairs at Location R, in the sequence shown in Figure 1007 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten bolts until no loss of torque occurs.

(j) Install the remaining lubricated bolts (1012/4) (boltheads down), washers (1012/3) (two under each nut), and nuts in the flange boltholes in the front flange of the 10th stage case.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(k) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the bolts until no loss of torque occurs.

NOTE: Do not tighten the bolt just to the left of the borescope boss and the bolt just to the right clockwise of the 6th anti−rotation lug at this time.

Subtask 72−35−00−430−101:

(15) Install the 11th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 11th stage air seal, larger OD and shorter leg of the air seal down, on the 10th stage case. Align the offset hole in the 11th stage air seal with the offset hole in the rear flange of the 10th stage case.

NOTE: The 11th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(f) Install a minimum of 30 work bolts (boltheads down), washers and nuts equally spaced into the 11th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(h) Remove the work bolts, nuts and washers.

(i) Remove the protective cover from the blades.

(16) Make marks to show the location of the anti-rotation lugs of the 11th stage compressor case on the 11th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 11th stage compressor case, flange with the reference line on the OD up, on the 11th stage air seal. Align the offset hole in the front flange with the offset hole in the 11th stage air seal.

NOTE: The 11th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti-rotation lugs in the ID of the 11th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 11th stage air seal.

(d) Remove the 11th stage compressor case.

(17) Install the 11th stage HPC stator (vane) segments. See Figure 1013.

(a) Obtain the thirteen 11th stage HPC stator (vane) segments. See 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(b) Make sure that the sealant cure time is completed.

(c) Install the stator (vane) segments to the air seal assembly as follows:

1 If necessary, you can use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments with the thicker seal land down and away from the assembler.

3 Align the anti−rotation lug slot in the stator (vane) segment with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife−edges of the drum rotor.

(d) Install an 11th stage stator (vane) segment to the air seal as specified above at approximately the top (12 o'clock) position. Align the left vane anti−rotation lug slot with the reference ink mark on the air seal on the assemblers left.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining 12 stator (vane) segments.

(18) (Reference 1580) Install the 11th stage compressor case assembly. See Figure 1014.

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 11TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE−EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife−edge seal and that the vanes can move.

(c) Install the case, rear flange with the reference line on the OD up, over the 11th stage vanes on the 11th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 11th stage air seal, and the anti-rotation lugs in the case with mating slots in the stator (vane) segments.

NOTE: The 11th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Engine Oil P03-001 to the 12 nuts you will install on the dowel bolts in the front flange of the 11th stage case.

(f) Install 12 washers and lubricated nuts, onto the dowel bolts in the front flange of the 11th stage case.

(g) Apply Engine Oil P03-001 to the 72 bolts.

(h) Install 16 bolts (1014/4) (boltheads down), washers, and nuts, eight pairs equally spaced to the boltholes in the front flange of the 11th stage case. See Figure 1007.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(i) Tighten and torque the 16 bolts, eight pairs at Location R, in the sequence shown in Figure 1007 to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten bolts until no loss of torque occurs.

(j) Apply Engine Oil P03-001 to the 56 remaining bolts.

(k) Install the remaining 56 lubricated bolts (boltheads down), washers (under nuts), and nuts in the boltholes in the front flange of the 11th stage case. See Figure 1010 (Sheet 3).

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(l) Use an alternating pattern (180 degrees apart) Tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(m) On the 10th stage compressor case front flange, locate the bolt just to the left of the borescope boss and the bolt just to the right clockwise of the 6th anti−rotation lug that was left handtight. Tighten and torque these bolts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

Subtask 72−35−00−430−102:

(19) Install the 12th stage compressor air seal assembly. See Figure 1015.

(a) Install two PWA 100379 Alignment Pins equally spaced in the larger, 0.300 inch (7.620 mm), boltholes in the rear flange of the 11th stage case.

(b) Make sure that the air seal has the correct seal set mating number.

(c) Place the 12th stage compressor air seal (1015/1) (larger OD of the air seal down) on the 11th stage compressor case.

(d) Align the offset hole in the air seal (1015/1) with the offset hole in the rear flange of the 11th stage case.

NOTE: The 12th stage compressor air seal flange OD has a reference line at the approximate 12 o'clock position.

(e) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(f) Install a suitable protective cover over the blades.

(g) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(h) Install a minimum of 30 work bolts (boltheads down), washers, and nuts equally spaced into boltholes in the 12th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(i) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(j) Remove the Alignment Pins, work bolts, washers, and nuts.

(k) Remove the protective cover from the blades.

(20) Make marks to show the location of the anti−rotation lugs of the 12th stage compressor case on the 12th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 12th stage compressor case, larger OD flange down, onto the 12th stage air seal. Align the offset hole in the front flange with the offset hole in the 12th stage air seal.

NOTE: The 12th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti−rotation lugs in the ID of the 12th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 12th stage air seal.

(d) Remove the 12th stage compressor case.

(21) Install the 12th stage HPC stator (vane) segments. See Figure 1016.

(a) Obtain the twelve 12th stage HPC stator (vane) segments. See 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(b) Make sure that the sealant cure time is completed.

(c) Install the stator (vane) segments to the air seal assembly as follows:

1 If necessary, you can use Beeswax P05-395 or Paraffin Wax Blend P05-396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments on the air seal with the thicker seal land down and away from the assembler.

3 Align the anti-rotation lug slot in the stator (vane) segment with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife-edges of the drum rotor.

(d) Use the procedure as specified above and install an eight stator (vane) segment to the air seal at approximately the top (12 o'clock) position. Align the anti-rotation lug slot in the left vane with the reference ink mark on the air seal to the assemblers left.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining stator (vane) segments in the following sequence:

One seven stator (vane) segment
Two eight stator (vane) segments
One seven stator (vane) segment
Two eight stator (vane) segments
One seven stator (vane) segment
Two eight stator (vane) segments
One seven stator (vane) segment
One eight stator (vane) segment

(22) (Reference 1580) Install the 12th stage compressor case assembly. See Figure 1017.

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 12TH STAGE COMPRESSOR CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE-EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife-edge seal and that the vanes can move.

(c) Install the case, larger OD flange down, over the 12th stage vanes on the 12th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the air seal, and the anti-rotation lugs in the case with mating slots in the stator (vane) segments.

NOTE: The 12th stage compressor rear flange OD has a reference line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Tape P05-341 to the OD of the case to cover all through holes.

(f) Starting at the 12 o'clock position, and moving to the assemblers left, make a mark at every 5th hole in the 12th stage case front flange.

NOTE: You will not put bolts in the holes with the marks in the following step.

NOTE: The 12th stage compressor rear flange OD has a reference line at the approximate 12 o'clock position.

(g) Apply Engine Oil P03-001 to 36 bolts.

(h) Install 16 lubricated bolts (boltheads up), washers (below the flange) and nuts, eight pairs equally spaced, to the boltholes in the front flange of the 12th stage case.

NOTE: Do not put bolts in the holes with the marks at this time.

(i) Tighten and torque the bolts, eight pairs at Location R, in the sequence shown in Figure 1007 to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten bolts until no loss of torque occurs.

(j) Install the 20 remaining lubricated bolts (boltheads up), washers (below the flange) and nuts, to the boltholes in the front flange of the 12th stage case.

NOTE: Do not put bolts in the holes with the marks at this time.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(k) Tighten and torque the remaining bolts to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten bolts until no loss of torque occurs.

NOTE: If necessary, use the PWA 100383 Torque Adapter to tighten the bolts at the borescope location.

(l) Apply Engine Oil P03-001 to the 12 nuts you will install onto the dowel bolts.

(m) Install 12 washers and lubricated nuts onto the dowel bolts in the front flange of the 12th stage case.

(n) Using and alternating pattern (180 degrees apart) tighten and torque the nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

Subtask 72-35-00-430-103:

(23) Install the 13th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Place the 13th stage compressor air seal (larger OD and longer leg of the rubstrip down) on the 12th stage compressor case. Align the offset hole of the 13th stage air seal with the offset hole in the rear flange of the 12th stage case.

NOTE: The 13th stage compressor air seal flange OD has a reference line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03-001 to a minimum of 30 work bolts.

(f) Install a minimum of 30 work bolts (boltheads down), washers and nuts equally spaced into boltholes in the 13th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(h) Remove the work bolts, nuts, and washers.

(i) Remove the protective cover from the blades.

(24) Make marks to show the location of the anti-rotation lugs of the 13th stage compressor case on the 13th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 13th stage compressor case, bolts in the rear flange up, on the 13th stage air seal. Align the offset hole in the front flange with the offset hole in the air seal.

NOTE: The 13th stage compressor case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti-rotation lugs in the ID of the 13th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 13th stage air seal.

(d) Remove the 13th stage compressor case.

(25) Install the 13th stage HPC stator (vane) segments. See Figure 1018.

(a) Obtain the twelve 13th stage HPC stator (vane) segments. See 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(b) Make sure that the sealant cure time is completed.

(c) Install the stator (vane) segments on the air seal assembly as follows:

1 If necessary, you can use Beeswax P05-395 or Paraffin Wax Blend P05-396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments that follow on the air seal assembly, thicker seal land down and away from the assembler.

3 Align the anti-rotation lug slot in the stator (vane) segment with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife-edges of the drum rotor.

(d) Install a stator (vane) segment to the air seal assembly as specified above at approximately the top (12 o'clock) position. Align the left vane anti-rotation lug slot with the reference ink mark on the air seal to the assemblers right.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining 11 stator (vane) segments.

(26) (Reference 1580) Install the 13th stage compressor case assembly. See Figure 1019 (Sheet 1).

(a) Make sure that the case (1019/1) has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 13TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE−EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife−edge seal and that the vanes can move.

(c) Install the case, rear flange with bolts up, over the 13th stage vanes on the 13th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the air seal, and the anti−rotation lugs in the case with the mating slots in the stator (vane) segments.

NOTE: The 13th stage compressor case rear flange OD has a reference line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Engine Oil P03−001 to the 12 nuts (1019/6) you will install on the dowel bolts in the following step.

(f) Install the 12 lubricated nuts (1019/6) and washers (1019/4) onto the dowel bolts in the front flange of the 13th stage case (1019/1).

(g) Apply Engine Oil P03−001 to the 24 bolts (1019/5).

(h) Install 24 bolts (boltheads down), washers (above the flange), and nuts to the through holes in the front flange of the 13th stage case.

NOTE: Do not install bolts to the clinch nut locations at this time.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(i) Tighten and torque 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1007 to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(j) Use an alternating pattern (180 degrees apart) to tighten and torque the remaining nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

Subtask 72-35-00-430-104:

(27) Install the 14th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Place the 14th stage compressor air seal (larger OD and longer leg of rubstrip down) on the 13th stage compressor case. Align the offset hole of the 14th stage air seal with the offset hole in the rear flange of the 13th stage case.

NOTE: The 14th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03-001 to a minimum of 30 work bolts.

(f) Install a minimum of 30 work bolts (boltheads down), washers and nuts equally spaced into boltholes in the air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 - 150 lb-in. (15.818 - 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(h) Remove the work bolts, washers, and nuts.

(i) Remove the protective cover from the blades.

(28) Make marks to show the location of the anti-rotation lugs of the 14th stage compressor case on the 14th stage air seal.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the 14th stage compressor case, bolts in the rear flange up, on the 14th stage air seal. Align the offset hole in the front flange with the offset hole in the 14th stage air seal.

NOTE: The 14th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(c) Locate the anti-rotation lugs in the ID of the 14th stage compressor case. Use an approved pen to temporarily mark the lug positions on the OD of the 14th stage air seal.

(d) Remove the 14th stage compressor case.

(29) Install the 14th stage HPC stator (vane) segments. See Figure 1020.

(a) Obtain the twelve 14th stage HPC stator (vane) segments. See 72-35-00, Assembly-06 (Task 72-35-00-430-006).

(b) Make sure that the sealant cure time is completed.

(c) Install the stator (vane) segments on the air seal assembly as follows:

1 If necessary, you can use Beeswax P05-395 or Paraffin Wax Blend P05-396 to hold the vanes in a horizontal position.

2 Install the stator (vane) segments that follow on the air seal assembly, thicker seal land down and away from the assembler.

3 Align the anti-rotation lug slot in the stator (vane) segment with the reference ink marks on the air seal.

4 Make sure that the vanes do not touch the knife-edges of the drum rotor.

(d) Install a ten stator (vane) segment to the air seal assembly as specified above to the left of the top (12 o'clock) position. Align the left vane anti-rotation lug slot with the reference ink mark.

NOTE: Because of the adjacent studs, it can be easier to not install each stator segment fully until the last stator segment is installed. You can then move the vane segments as necessary to install the last stator segment. With all of the stator segments not fully installed, move the stator segments into their correct position.

(e) Going to the assemblers right, use the procedure as specified above and install the remaining stator (vane) segments in the following sequence:

One eight stator (vane) segment
One eight stator (vane) segment
One ten stator (vane) segment
One eight stator (vane) segment
One eight stator (vane) segment
One ten stator (vane) segment
One eight stator (vane) segment
One eight stator (vane) segment
One ten stator (vane) segment
One eight stator (vane) segment with borescope

hole
One eight stator (vane) segment

(30) (Reference 1580) Install the 14th stage compressor case. See Figure 1021.

(a) Make sure that the case has the correct seal set mating number.

CAUTION: AS YOU INSTALL THE 14TH STAGE CASE, THE ID OF THE STATOR (VANE) SEGMENTS CAN FALL DOWNWARD AND ENGAGE THE KNIFE-EDGE SEAL ON THE DRUM ASSEMBLY.

CAUTION: THE STATOR (VANE) SEGMENTS MUST BE LOOSE AFTER THE CASE IS INSTALLED OR DAMAGE TO THE DRUM OR VANES CAN OCCUR.

(b) Pull the stator (vane) segments upward and outward as you install the case in the following step. This will make sure that the vanes do not engage the knife-edge seal and that the vanes can move.

(c) Install the case, rear flange with bolts up, over the 14th stage vanes on the 14th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 14th stage air seal, and the anti-rotation lugs in the case with mating slots in the stator (vane) segments.

NOTE: The 14th stage case rear flange OD has a reference line at the approximate 12 o'clock position.

(d) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(e) Apply Engine Oil P03-001 to the 18 nuts you will install onto the dowel bolts.

(f) Install 18 washers and lubricated nuts onto the dowel bolts in the front flange of the 14th stage case.

(g) Apply Engine Oil P03-001 to the 42 bolts.

(h) Install 16 lubricated bolts (boltheads down), washers (above the flange) and nuts, eight pairs equally spaced, to the boltholes in the front flange of the 14th stage case.

(i) Tighten and torque 16 nuts total, eight pairs at Location R, in the special sequence shown in Figure 1007 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until there is no loss of torque.

(j) Install the remaining lubricated bolts (boltheads down), washers (above the flange) and nuts.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(k) Use an alternating pattern (180 degrees apart), to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until there is no loss of torque.

Subtask 72−35−00−430−105:

(31) Install the 13th and 14th stage compressor heat shield (1022/1). See Figure 1022.

(a) Remove the protective tape from the case assemblies.

(b) Remove any remaining tape adhesive from the cases. Use the SPOP 208 (Task 70−21−00−110−040) wipe method, Standard Practices Manual, PN 585005.

(c) Transfer a mark from the reference line at the 12 o'clock position on the OD of the rear flange of the 14th stage case to the rear face of the 14th stage case.

NOTE: The mark will be used to position the 15th stage air seal after installation of the 13th stage heat shield.

(d) Apply Engine Oil P03−001 to the 24 bolts (1022/5).

(e) Starting at the clinch nut in the front flange of the 13th stage compressor case to the right of the offset hole (12 o'clock) position and working to the assemblers right, loosely assemble a 13th stage compressor heat shield (1022/3) (recessed side against the flange), a retainer (1022/4) (angle up), and a lubricated bolt (1022/5).

(f) Continue to the assemblers right, loosely install the 10 remaining retainers (1022/4), one retainer (1022/2), and the remaining heat shield (1022/3). Install the retainer (1022/2), with the lug detail, at the fourth retainer from the 12 o'clock location (opposite the borescope boss).

NOTE: The location of the shields (1022/3) is not important.

(g) Expand the heat shield (1022/1) to its maximum diameter.

(h) Install the heat shield (angle end up) down over the 13th stage compressor case to a point just above the 12th stage compressor case rear flange.

(i) Align the borescope hole in the heat shield with the 15th stage borescope boss.

(j) Close the heat shield around the case and position the heat shield rear hook detail over the rear flange of the 14th stage case. Keep the gaps at the ends of the heatshield approximately equal.

(k) Put the previously installed heat shield retainers (1022/2) and (1022/4) and heat shields (1022/3) to the rear flange of the 12th stage compressor case.

(l) Make sure that the lug in the heat shield retainer (1022/2) aligns with the notch in the heat shield which is 180 degrees from the borescope boss.

(m) Tighten and torque the 24 bolts (1022/5) to 75 − 85 lb−in. (8.474 − 9.604 N.m).

(32) Install the 15th stage compressor air seal assembly. See Figure 1023.

(a) Make sure that the air seal (1023/1) has the correct seal set mating number.

(b) Install the 15th stage air seal, heat shield retaining leg down, onto the 14th stage compressor case. Align the offset hole in the air seal with the offset hole in the rear flange of the 14th stage case, at the approximate 12 o'clock position.

NOTE: The 15th stage air seal flange OD has a reference line at the approximate 12 o'clock position.

(c) Make sure that the air seal engages the 13th and 14th stage heat shield, and that the air seal engages the upper vane foot of the stator (vane) segments.

(d) Install a suitable protective cover over the blades.

(e) Apply Engine Oil P03-001 to a minimum of 30 work bolts.

CAUTION: MAKE SURE THAT THE 15TH STAGE AIR SEAL ENGAGES THE 13TH AND 14TH STAGE HEAT SHIELD BEFORE YOU INSTALL THE AIRSEAL.

(f) Install a minimum of 30 equally spaced lubricated work bolts, washers, under boltheads, into the 15th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the bolts to 140 - 150 lb-in. (15.818 - 16.948 N.m) to seat the air seal. Continue to tighten the bolts until no loss of torque occurs.

(h) Remove the work bolts and washers.

(33) Install the 12th stage compressor heat shields. See Figure 1024.

(a) Install the upper (1024/5) and lower (1024/7) inner heat shields into the recess in the front flange of the 12th stage case and position the ends of the heat shields at the 3 and 9 o'clock positions.

(b) Install the left (1024/4) and right (1024/8) outer heat shields on top of the inner heat shields and position the ends of the heat shields at the 6 and 12 o'clock positions.

(c) Apply Engine Oil P03-001 to the 12 bolts (1024/1).

(d) Install 12 spacers (1024/3), bushings (1024/2) and 12 lubricated bolts (1024/1) through the boltholes in the heat shields.

(e) Install 12 nuts (1024/6) to the bolts fingertight.

(f) Tighten and torque the 12 nuts to 75 - 85 lb-in. (8.474 - 9.604 N.m). Continue to tighten the nuts until no loss of torque occurs.

(34) Install the 11th stage compressor heat shield. See Figure 1025 (Sheets 1 and 2).

(a) Apply Engine Oil P03-001 to 24 bolts (1025/2) that you will use to install the 11th stage heat shield retainers.

(b) Locate the second clinch nut in the front flange of the 10th stage compressor case to the left of the top (12 o'clock) position.

NOTE: This clinch nut will be the location for the right bolt in the special retainer (1025/3).

(c) Assemble a 10th stage compressor heat shield (1025/1) (recessed side against the flange). Assemble the special retainer (1025/3) with the right bolt hole in the retainer at the clinch nut identified in the previous step. Loosly install the heat shield and retainer with two lubricated bolts (1025/2).

(d) Continue to the assemblers right, loosely install the 11 remaining retainers (1025/4) and the remaining heat shield (1025/2) with bolts (1025/2). With the special retainer (1025/3) (with the detail lug) opposite the borescope boss. See Figure 1025 (Sheet 2).

NOTE: The location of the heat shields (1025/1) is not important.

(e) Expand the 11th stage compressor heat shield (1025/5) to its maximum diameter.

(f) Install the heat shield (1025/5) (angle up) down over the 10th stage case to a point just above the 9th stage case rear flange.

(g) Close the heat shield (1025/1) around the case aligning the heat shield borescope hole with the boss in the 10th stage compressor case. Keep the gaps at the ends of the heatshield approximately equal.

(h) Hold the two heat shields (1025/1) against the upper flange of the 9th stage case while you slide the heat shield (1025/5) up to engage the slot between the 11th and the 12th stage compressor cases.

NOTE: The lower lip of the 11th stage heat shield (1025/5) must engage the outer flange of the heat shields (1025/1).

(i) With the heat shields (1025/1) and (1025/5) correctly engaged, position the previously installed retainers (1025/3) and (1025/4) to the rear flange of the 9th stage case. Tighten the bolts (1025/2) fingertight.

(j) Make sure that the upper end of the heat shield (1025/5) is in the slot between the 11th and the 12th stage compressor cases.

(k) Tighten and torque the bolts (1025/2) to 75 - 85 lb-in. (8.474 - 9.604 N.m).

(35) Install the 9th stage compressor heat shields. See Figure 1026 (Sheets 1 and 2).

(a) Install the upper inner heat shield (1026/2) into the groove in the forward flange of the 9th stage case and rotate it approximately eight degrees clockwise to align the holes in the heat shield with the through holes in the 9th case front flange. See Figure 1026 (Sheet 2).

NOTE: The ends of the heat shields will be at approximately the 2:30 and 8:30 o'clock positions.

(b) Install the lower inner heat shield (1026/2) into the groove in the forward flange of the 9th stage case and rotate approximately 8 degrees) clockwise to align the holes in the heat shield with the 12 through holes in the case flange.

(c) Install the outer left and right heat shields (1026/1) on top of the previously installed inner heat shields.

(d) Rotate these heat shields approximately 8 degrees counter clockwise to align with the holes in the heat shields with the through holes in the 9th stage case front flange.

NOTE: The ends of the heat shields will be at approximately the 5:30 and 11:30 o'clock positions.

(e) Install two 9th stage front heat shields (1026/10) (angle up) below the 8th stage case rear flange.

NOTE: The ends of the heat shields will be at approximately the 2:30 and 8:30 o'clock positions.

(f) At the two ends of the heat shields just installed, install covers (1026/6), a bushing (1026/8), and a lubricated bolt (1026/9) up through the 8th stage case flange and the rear heat shield. Install a spacer (1026/5), a bushing (1026/4), and a nut (1026/3) to the bolt fingertight.

(g) At the ten remaining holes, install a spacer (1026/7), a bushing (1026/8), and a lubricated bolt (1026/9) up through the 8th stage case flange and the rear heat shield. Install a spacer (1026/5), a bushing (1026/4), and nut (1026/3) to the bolt fingertight.

(h) Tighten the bolts (1026/9) to 75 − 85 lb−in. (8.474 − 9.604 N.m).

Subtask 72−35−00−430−106:

(36) Install the gaskets and seals in the compressor cases. See Figure 1027.

(a) Install a new gasket (1027/4) in the upper groove in the 9th stage case.

(b) Install the seal ring (spring) (1027/3) in the (seal holder) groove in the 12th stage case.

(c) If necessary, you can use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the seals in position.

(d) Install the seal ring (1027/2) over the spring (1027/3) in the (seal holder) groove in the 12th stage case.

(e) Install the seal (1027/1) in the vertical (seal holder) groove in the front flange of the 12th stage case.

(37) (Reference 1580) Temporarily assemble the HPC rear support to the HPC rear case. See Figure 1028 (Sheet 2) and Figure 1028 (Sheet 3).

(a) Attach a hoist to the lift hole in PWA 105504 Adapter. Use the hoist to lift the Adapter and put it over the rear flange of the HPC rear case (1028/1). Align the boltholes in the Adapter with the boltholes in the case. Install the Adapter to the rear case with eight detail screw assemblies and four nut plates.

NOTE: The Adapter has a scribed line on the OD of the Adapter. Align this line with the offset hole in the HPC rear case (rear flange).

(b) Use the hoist to put the rear case on a bench, rear (smaller ID flange with dowel bolts) end up.

(c) Remove the screw assemblies and nut plates that attach the Adapter to the case.

(d) Remove the Adapter from the case.

(e) Make sure that the rear case has the correct seal set mating number.

(f) Make sure that the HPC rear support (1028/1) has the correct seal set mating number.

CAUTION: YOU CAN MIS−ASSEMBLE THE REAR SUPPORT ON THE HPC REAR CASE AND DAMAGE TO THE CASE AND/OR SUPPORT CAN OCCUR.

(g) Find the "X" mark on the rear inner flange of the HPC rear case. This is at approximately the 12 o'clock position. Make a temporary mark on the outer flange of the case at the "X" location. Refer to 70−11−00, Standard Practices Manual, PN 585005.

(h) Find the reference 0.123 − 0.128 inch (3.125 − 3.251 mm) diameter non−through hole (dimple) in the rear face, outer flange, of the HPC rear support. This reference diameter is approximately at the 12 o'clock position.

(i) Align the non−through hole (dimple) reference on the HPC rear support with the "X" mark on the rear inner flange of the HPC rear case and lower the rear support onto the rear case.

(j) Apply Engine Oil P03−001 to eight work bolts (.250−28), approximately 1 inch (25.400 mm) long, that you will use to temporarily install in the HPC rear support (1028/1) to the HPC rear case (1028/3).

(k) Install the eight lubricated work bolts (1028/2) equally spaced at Positions BD in the HPC rear support outer flange. See Figure 1028 (Sheet 3).

(38) Remove the protective tape from the case assemblies.

(a) Remove any remaining tape adhesive from the cases. Use the SPOP 208 (Task 70−21−00−110−040) wipe method, Standard Practices Manual, PN 585005.

(39) Install two PWA 105609 Alignment Pins to the front flange of the HPC rear case. See Figure 1028 (Sheet 4).

(a) Install one pin at the jackscrew hole at the 4 o'clock position, and the second pin at the 7 o'clock position.

(b) To install the pin, remove the detail pin from the detail plate.

(c) Position the screw and plate into the jackscrew hole at the rear (upper) side of the front flange of the HPC rear case. Align the threaded hole with the bolthole next to the jackscrew hole, and install the detail pin through the bolthole and thread it into the threaded hole in the detail plate.

(d) Tighten the knurled screw to attach the pin to the case.

(40) Install the HPC rear case to the 8th stage compressor air seal. See Figure 1028 (Sheet 5).

(a) Attach a hoist to the lift hole in PWA 105504 Adapter. Use the hoist to lift the Adapter and put it over the HPC rear case. Align the boltholes in the Adapter with the boltholes in the case. Install the Adapter to the rear case with eight detail screw assemblies and four nut plates.

NOTE: The Adapter has a scribed line on the OD of the outer ring. Align this line with the offset hole in the rear flange of the HPC rear case.

CAUTION: YOU CAN MIS−ASSEMBLE THE HPC REAR SUPPORT ON THE 15TH STAGE COMPRESSOR AIR SEAL IF THE 12 O'CLOCK MARKINGS ARE NOT PROPERLY ALIGNED.

(b) Use the hoist to carefully lower the HPC rear case and rear support assembly over the 8th through 15th stage case assembly.

(c) Use the rear support as a guide to align the 12 o'clock position of the HPC rear case with the top 12 o'clock of the 15th stage air seal.

(d) Align the hole next to the reference hole in the OD flange of the rear support with the hole marked "X" in the 15th stage air seal, and lower the rear case front flange onto the 8th stage air seal.

(e) Remove the screw assemblies and nut plates that attach the Adapter to the case.

(f) Remove the Adapter from the case.

CAUTION: YOU CAN DAMAGE THE HPC REAR SUPPORT IF YOU DO NOT REMOVE THE BOLTS THAT ATTACH THE HPC REAR SUPPORT TO THE REAR CASE.

(g) Remove all of the bolts that were used to attach the HPC rear support to the HPC rear case.

(h) Make sure that there is a minimum of one PWA 105768 Spacer next to each work bolt before you install the HPC rear case front flange to the 8th stage air seal.

(i) Install a minimum of 40 equally spaced lubricated work bolts (boltheads up), threads lubricated with Engine Oil P03-001, into the boltholes in Flange H. Install washers and nuts to the bolts. See Figure 1028 (Sheet 5).

NOTE: Flange H is the front (lower) flange of the HPC rear case.

CAUTION: YOU CAN DAMAGE THE REAR SUPPORT IF YOU DO NOT TIGHTEN THE BOLTS EVENLY.

(j) You must monitor the HPC rear support while you tighten the bolts to make sure you install the HPC rear case evenly. Use an alternating pattern (180 degrees apart) to tighten the bolts in Flange H.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(k) Use an alternating pattern (180 degrees apart) to torque the bolts to 190 − 210 lb−in. (21.467 − 23.727 N.m). Continue to tighten the bolts until no loss of torque occurs.

(l) Loosen all of the work bolts used to install the HPC rear case front flange to the 8th stage air seal.

(m) Remove all of the PWA 105768 Spacers located between the HPC front (split) case and the 8th stage air seal.

NOTE: You can use jackscrews in the HPC front (split) case to lift the seal set assembly weight off of the assembly spacers. This can help you remove the assembly spacers.

(n) Remove the two Alignment Pins from the front flange of the HPC rear case.

(41) Install the 8th stage air seal and HPC rear case and to the HPC front case.

(a) Use an alternating pattern (180 degrees apart) to torque the bolts to 190 − 210 lb−in. (21.467 − 23.727 N.m). Continue to tighten the work bolts until no loss of torque occurs.

(b) Remove the work bolts, washers, and nuts.

(c) Refer to Install The Flange H Brackets And Hardware, 72−35−00, Assembly−21 (Task 72−35−00−430−021).

(42) Install the 7th stage synchronizing ring runners to Flange H. See Figure 1028 (Sheet 6).

(a) Apply Engine Oil P03−001 to the 22 bolts (1028/3).

(b) Assemble the 11 runners (1028/2), lug end up, at Location K; and attach the runners with the lubricated bolts (1028/3), bolt heads up, and nuts (1028/1).

Subtask 72−35−00−430−108:

(43) Install the HPC rear support (1029/1). See Figure 1029 (Sheet 1) and (Sheet 2).

(a) Remove the HPC rear support from the HPC rear case.

(b) Install one of the correct spacer class Spacer AB (1029/8) with the ovalizied hole at the bottom (6 o'clock) position of the outer case inner rear flange, then install the seven remaining spacers onto the flange.

(c) Make sure that the HPC rear support (1029/1) has the correct seal set mating number.

CAUTION: YOU CAN MIS−ASSEMBLE THE HPC REAR SUPPORT ON THE 15TH STAGE AIR SEAL IF THE HOLES WITH THE MARKINGS ARE NOT PROPERLY ALIGNED.

(d) Align the boltholes in the HPC rear support (1029/1) with the botholes in the HPC rear case and the 15th stage air seal.

NOTE: The HPC rear support has a reference spherical radius at the approximate 12 o'clock position.

(e) With the boltholes aligned, lower the HPC rear support (1029/1) onto the inner flange of the HPC rear case and the 15th stage air seal.

(f) Apply Engine Oil P03−001 to 64 bolts (1029/6).

(g) Install eight lubricated bolts (1029/6) and washers (1029/7) equally spaced at Positions BD in the HPC rear support outer flange. Run down the bolts to just touch the flange face. See Figure 1029 (Sheets 1 and 2).

NOTE: There are 16 boltholes in the HPC rear support outer flange that are larger in diameter. Do not install bolts in these boltholes at this time.

(h) Apply Engine Oil P03−001 to 18 bolts (1029/2).

(i) Install 18 bolts (1029/2) and washers (1029/3) to the HPC rear support inner flange. Bolts are not necessary at Locations AU. See Figure 1029 (Sheets 1 and 3).

(j) Apply Engine Oil P03-001 to 24 nuts (1029/4).

(k) Install 48 washers (1029/5) two on each dowel bolt, and nuts (1029/4) to the 24 dowel bolts in the inner flange of the HPC rear support (1029/1). Tighten the nuts fingertight.

NOTE: You can use non-self locking work nuts to prevent over stressing the bill of material parts and replace the work nuts after seating the HPC rear support.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(l) Torque the inner flange bolts (1029/2) and nuts (1029/4) to 140 - 150 lb-in. (15.818 - 16.948 N.m) using an alternating pattern 180 degrees apart. Continue to tighten the bolts and nuts until no loss of torque occurs.

(m) Install the remaining lubricated bolts (1029/6) and washers (1029/7) to the HPC rear support outer flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(n) Torque the 64 outer flange bolts (1029/6) to 105 - 115 lb-in. (11.863 - 12.993 N.m) using an alternating pattern 180 degrees apart. Continue to tighten the bolts until no loss of torque occurs.

(44) Install the 15th stage heat shield. See Figure 1030.

(a) Align the boltholes in the 15th stage HPC upper rear heat shield (1030/2) and lower heat shield (1030/1) with the boltholes in the HPC rear support and lower the heat shields onto the rear support.

NOTE: The ends of the heat shields will be at approximately the 2:30 and 8:30 o'clock positions.

(b) Install two covers (1030/6) with bushings (1030/4) at the bolthole locations at the ends of the heat shields.

(c) Install 16 spacer plates (1030/5) with bushings (1030/4) at the remaining bolthole locations in the heat shields.

(d) Apply Engine Oil P03−001 to the 18 bolts (1030/3).

(e) Install 18 lubricated bolts (1030/3) to the bushings in the heat shield. Tighten the bolts fingertight.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(f) Use an alternating pattern (180 degrees apart) to tighten and torque the 18 bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Continue to tighten the bolts until there is no loss of torque.

Subtask 72−35−00−430−109:

(45) Inspect the 15th stage compressor air seal for concentricity. See Figure 1031 (Sheet 1).

(a) Install PWA 105506 Constraint Ring on the rear flange of the HPC rear case.

1 Use a suitable sling to put the ring (step side down) over the rear flange of the HPC rear case.

2 Align the dowel pin in the ring with the offset dowel pin hole in the HPC rear case rear flange, at the 6 o'clock position, and lower the ring onto the rear case.

NOTE: The dowel pin in the constraint ring is at the 180 degree position on the constraint ring.

3 Use 12 cap screws (heads up), washers (under nuts), and nuts to install the ring to the case.

4 Use an alternating pattern, tighten the bolts to install the ring to the HPC rear case.

5 Make sure that the ring is against the case flange.

(b) Place PWA 87485 Gage on the rear of the Constraint Ring, with the two dowel pins on the bottom of the gage against the outside diameter of the Constraint Ring.

(c) Adjust the detail indicator so it touches the 15th stage air seal.

(d) Take 12 measurements at 12 equally spaced locations on the ID of the 15th stage air seal.

(e) The ID of the 15th stage air seal must be concentric with the HPC rear case within 0.010 in. (0.254 mm) at all 12 locations.

(f) Remove the Gage.

(g) Remove the Constraint Ring as follows.

1 Remove the cap screws, nuts and washers that attach the Constraint Ring to the HPC rear case.

2 Install jackscrews into six equally spaced threaded hole locations in the rear flange of the rear case.

3 Turn the jackscrews equally and evenly to loosen the Constraint Ring.

CAUTION: REMOVE THE CONSTRAINT RING FROM THE HPC REAR CASE CAREFULLY TO PREVENT DAMAGE TO THE DOWEL PIN DETAIL OF THE CONSTRAINT RING.

4 Use a suitable sling and hoist to remove the Constraint Ring from the rear case.

(46) Remove all of the tape from the HPC rear support.

Subtask 72−35−00−430−110:

(47) FOR THESE MODELS: 4152, 4156A, 4158
R Attach the PWA 107219 Fixture to the HPC rear case as follows.

(a) FOR THESE MODELS: 4152, 4156A, 4158
R Attach a hoist toPWA 107219 Fixture and raise the Fixture over the rear hub of rotor. See Figure 1032 (Sheet 1).

(b) FOR THESE MODELS: 4152, 4156A, 4158
Lower the Fixture to the HPC rear case.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Attach the Fixture to the HPC rear case.

(d) FOR THESE MODELS: 4152, 4156A, 4158
Install the PWA 85535 Nut over the rear end of the HPC rear hub. See Figure 1032 (Sheet 1).

(e) FOR THESE MODELS: 4152, 4156A, 4158
Position the PWA 85530 Wrench over the nut and engage the drive teeth in the nut.

(f) FOR THESE MODELS: 4152, 4156A, 4158
Insert the PWA 85536 Adapter into the rear end of the HPC rear hub.

(g) FOR THESE MODELS: 4152, 4156A, 4158
Torque the nut to 300 lb−in. (33.895 N.m).

(48) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R (Pre SB PW4ENG 72−562) Attach the PWA 107219 Fixture to the HPC rear case as follows.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Attach the hoist to the PWA 107219 Fixture and raise the Fixture over the rear shaft of the rotor. See Figure 1032 (Sheet 1).

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lower the Fixture to the HPC rear case.

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Tighten the Fixture to the case.

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the PWA 85535 Nut over the rear end of the HPC rear shaft. See Figure 1032 (Sheet 1).

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the PWA 85530 Wrench over the nut and engage the drive teeth in the nut.

(f) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Put the PWA 85536 Adapter into the rear end of the HPC rear shaft.

(g) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Torque the nut to 300 lb-in. (33.895 N.m).

(49) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R (Post SB PW4ENG 72-562) Attach PWA 107219 Fixture to the HPC rear case.

(a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
R Attach the hoist to the PWA 107219 Fixture and raise the Fixture over the rear shaft of the rotor.

(b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Lower the Fixture to the HPC rear case.

(c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Tighten the Fixture to the case.

(d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the PWA 88701 Nut over the rear end of the HPC rear shaft.

(e) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
Install the PWA 85530 Wrench over the nut and engage the drive teeth in the nut.

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Put the PWA 85536 Adapter into the rear end of the HPC rear shaft.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque the nut to 300 lb−in. (33.895 N.m).

(50) Trunnion the rotor and stator assembly to the front end up position as follows. See Figure 1032 (Sheet 3).

(a) Attach the PWA 88643 or PWA 88673 Sling to the hoist.

(b) Attach the Sling with two PWA 76154 Adapters to the Fixture on the HPC rear case and raise the rotor from the stand.

(c) Install a second hoist and the PWA 88643 or PWA 88673 Sling with two PWA 76154 Adapters to the front Fixture and trunnion the rotor to front end up.

(d) Lower the rotor to build stand and remove the Sling, hoist, and Adapters.

Subtask 72−35−00−430−113:

CAUTION: IT IS VERY IMPORTANT TO OBEY THE PROCEDURES IN THE STANDARD PRACTICES MANUAL, PN 585005 70−53, LOCKING DEVICES, WHEN YOU INSTALL (BORESCOPE) PLUG KEY WASHERS. INCORRECT INSTALLATION OF THE KEY WASHERS CAN CAUSE THE (BORESCOPE) PLUGS TO COME OUT. IF AN AP−5 OR AP−7 (BORESCOPE) PLUG IS NOT THERE, HOT GASSES FROM THE PLUG OPENING CAN CAUSE DAMAGE TO THE THRUST REVERSER.

(51) Install the AP−4 through AP−7 borescope plugs and new key washers. Refer to the requirements of Table 1001 and as follows. See Figure 1033.

AP Number And Location	Plug Locking Method	Plug Replacement Lubricant	Plug Torque lb-in. (N.m)
AP-4 Stage 8	Self-locking Insert	P06-054 Antiseize Paste	175 - 190 (19.772 - 21.467) Reference Number 1556
AP-5 Stage 10 Compr.	Key Washer 58H216	P06-054 Antiseize Paste	175 - 190 (19.772 - 21.467) Reference Number 1554
AP-6 Stage 12	Self-locking Insert	P06-054 Antiseize Paste	175 - 190 (19.772 - 21.467) Reference Number 1556
AP-7 Stage 14	Key Washer 58H216	P06-054 Antiseise Paste	175 - 190 (19.772 - 21.467) Reference Number 1554

HPC Borescope/Access Plug Installation Data
Table 1001

(a) Prior to installing borescope plugs, remove excess baked on compound from threads using a nylon brush.

(b) Apply Antiseize Paste P06-054 to threads and to plug head washer contact surface area.

NOTE: Do not use Engine Oil P03-001.

(c) Wipe off unwanted paste.

(d) Run in borescope plug to be sure plug is seated before applying torque per Table 1001.

(e) After you torque the borescope plug(s), bend the tabs of the key washer by the instructions in Chapter/Section 70-53 of the Standard Practices Manual, PN 585005.

1 Put the end of the crimper onto the end of the plug. Turn the crimper so the jaw is under a key washer tab.

2 Squeeze the crimper handle to bend the key washer tab until the tab makes contact with the hex head of the plug.

3 Release the handle and reposition the jaw so that it makes contact again at the base of the tab.

4 Squeeze the crimper handle to final bend the key washer tab until the tab makes contact with the hex head of the plug and maintains less than a 0.020 inch (0.508 mm) gap everywhere between the tab and the hex head of the plug.

5 Crimp all five (5) of the key washer tabs by the same method.

6 All tabs of the key washer must be bent, examine the tabs for the following conditions:

NOTE: Key washer PN 58H216 uses five tabs as an alternative to two. These additional tabs permit some deviation from the Standard Practices Manual, PN 585005 requirements but it is necessary that all five tabs meet these relaxed requirements. The variations to the Standard Practices Manual, PN 585005 procedure for this tab washer are as follows:

a All five tabs must be within 0.020 inch (0.508 mm) maximum of the hex head of the plug. If a tab overlaps two different faces of the hex head the 0.020 inch (0.508 mm) gap requirement must be kept between the tab and which ever face of the hex head has the larger surface area coverage with the tab. It is a good practice to bend the tab against the remaining face.

b It is not necessary that 75 percent of the base of the tab make contact with the hex head of the plug.

c It is not necessary that the key washer tabs be pulled away from the axis of the plug before you torque the plug. This requirement, as stated in the Standard Practices Manual, PN 585005 is meant for washers that have fewer tabs.

(52) Install bolts, threads lubricated with Engine Oil P03-001, to HPC rear case boss at approximately the 2:30 o'clock position. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). See Figure 1034.

D. Postrequisites

(1) Install The Flange J Brackets And Hardware. Refer to 72-35-00, Assembly-20 (Task 72-35-00-430-020).

(2) Determine the (Synchronizing Ring) Runner Clearances. Refer to 72-35-00, Assembly-02 (Task 72-35-00-400-002) for the symmetric case configuration or Task 72-35-00-400-002-A) for the asemmetric case configuration as applicable.

Task 72-35-00-400-002:

1. Determine Runner Clearances

A. Prerequisites

(1) Assemble high pressure compressor (HPC). See Assembly-01 (Task 72-35-00-400-001).

B. Equipment And Materials Necessary

Special Tools:

	PWA 85393	Pin, Rigging (3 Required)
	PWA 86197	Pin, Rigging
R R	PWA 87429	Adapter, Torque (IGV, 5th, And 6th Stage Synchronizing Ring Runner Bolts)
	PWA 102158	Crimper, Hand

Above rigging pin can be contained within the Rigging Pin Kit (PWA 85675).

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	8	72-35-00/12/280
Key Washer	8	72-35-00/13/280
Key Washer	8	72-35-00/14/280
Key Washer	8	72-35-00/15/280

C. Procedure
Figure 1001 and Figure 1002

Subtask 72-35-00-430-067:

(1) Install clevis assembly to inlet ring at 3 o'clock location. Secure clevis with bolts, threads lubricated with Engine Oil P03-001, and key washers. Install ring plate with bolts, threads lubricated with Engine Oil P03-001, and key washers. Tighten and torque all bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Bend tabs to secure bolts.

(2) Move inlet ring to vane open rig position. Install PWA 85393 Rigging Pin in ring to engage slot in case. Move ring back and forth to ensure ring is locked to case.

(3) (References 2101 through 2104) Determine unision ring shim thickness. See Figure 1001.

  (a) Insert shim stock or runner shims into radial clearance at four locations approximately 45 degrees either side of the axial flanges to prevent unison ring motion.

  (b) Measure and record the remaining seven radial clearances between runners and inlet ring.

  (c) Remove, measure and record the four shim thicknesses from step (a).

(4) Average clearance by adding the 11 readings and divide by 11. Round off to three decimal places.

(5) Subtract desired radial clearance for this stage from average value. See Table 1001. The remaining value represents the shim thickness required at each runner location. Shim thickness may be obtained by selecting any combination of shims (Classes 1 − 5).

Variable Stator	Clearance − Inches (mm)
Inlet	0.009 − 0.013 (0.229 − 0.330)
5th	0.009 − 0.013 (0.229 − 0.330)
6th	0.014 − 0.018 (0.356 − 0.457)
7th	0.014 − 0.018 (0.356 − 0.457)

Runner To Ring Clearance
Table 1001

(6) Install shims as follows:

  (a) Loosen bolts securing runners and install shims, as determined by previous step, under runner.

  NOTE: Earlier synchronizing ring runner shims have bolt holes which require removal of runner bolts for insertion of shims, while newer configuration shims have slots which only require loosening of runner bolts for shim insertion.

(b) Use the PWA 87429 Torque Adapter and tighten and torque bolts to 45 − 55 lb−in. (5.084 − 6.214 N.m).

(c) Bend the tabs of the key washers with the PWA 102158 Crimper to safety the bolts. The long jaw of the Crimper must locate on the tab of the washer. Squeeze the Crimper handle to bend the tab of the washers.

Subtask 72−35−00−430−068:

CAUTION: FIFTH AND SIXTH STAGE SYNCHRONIZING RING CLEVISES AND 7TH STAGE SYNCHRONIZING RING MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANES SCHEDULE (SB PW4ENG 72−197).

(7) Install clevis assembly to Stage 5 ring at 3 o'clock location. Secure clevis with bolts, threads lubricated with Engine Oil P03−001, and key washers. Install ring plate with bolts, threads lubricated with Engine Oil P03−001, and key washers. Tighten and torque all bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend tabs to secure bolts.

NOTE: Do not intermix synchronizing plates and synchronizing rings. Make sure the correct synchronizing plate is used with the correct synchronizing ring.

(8) Move Stage 5 ring to vane open rig position. Install Rigging Pin (PWA 85393) in the ring to engage the slot in case. Move ring back and forth to ensure ring is locked to case.

(9) (Reference 2102) Determine unision ring shim thickness. See Figure 1001.

(a) Insert shim stock or runner shims into radial clearance at four locations approximately 45 degrees either side of the axial flanges to prevent unison ring motion.

(b) Measure and record the remaining seven radial clearances between runners and Stage 5 ring.

(c) Remove, measure and record the four shim thicknesses from step (a).

(10) Average clearance by adding the 11 readings and divide by 11. Round off to three decimal places.

(11) Subtract desired radial clearance for this stage from average value. See Table 1001. The remaining value represents the shim thickness required at each runner location. Shim thickness may be obtained by selecting any combination of shims (Classes 1 − 5).

(12) Install shims as follows:

(a) Loosen bolts securing runners and install shims, as determined by previous step, under runner.

NOTE: Earlier synchronizing ring runner shims have bolt holes which require removal of runner bolts for insertion of shims, while newer configuration shims have slots which only require loosening of runner bolts for shim insertion.

(b) Use the PWA 87429 Torque Adapter and tighten and torque bolts to 45 − 55 lb−in. (5.084 − 6.214 N.m).

(c) Bend the tabs of the key washers with the PWA 102158 Crimper to safety the bolts. The long jaw of the Crimper must locate on the tab of the washer. Squeeze the Crimper handle to bend the tab of the washers.

Subtask 72−35−00−430−069:

CAUTION: FIFTH AND SIXTH STAGE SYNCHRONIZING RING CLEVISES AND 7TH STAGE SYNCHRONIZING RING MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANES SCHEDULE (SB PW4ENG 72−197).

(13) Install clevis assembly to Stage 6 ring at 3 o'clock location. Secure clevis with bolts, threads lubricated with Engine Oil P03−001, and key washers. Install ring plate with bolts, threads lubricated with Engine Oil P03−001, and key washers. Tighten and torque all bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend tabs to secure bolts.

NOTE: Do not intermix synchronizing plates and synchronizing rings. Make sure the correct synchronizing plate is used with the correct synchronizing ring.

(14) Move Stage 6 ring to vane open rig position. Install Rigging Pin (PWA 85393) in ring to engage slot in case. Move ring back and forth to ensure ring is locked to case.

(15) (Reference 2103) Determine unision ring shim thickness. See Figure 1001.

(a) Insert shim stock or runner shims into radial clearance at four locations approximately 45 degrees either side of the axial flanges to prevent unison ring motion.

(b) Measure and record the remaining seven radial clearances between runners and Stage 6 ring.

(c) Remove, measure and record the four shim thicknesses from step (a).

(16) Average clearance by adding the 11 readings and divide by 11. Round off to three decimal places.

(17) Subtract desired radial clearance for this stage from average value. See Table 1001. The remaining value represents the shim thickness required at each runner location. Shim thickness may be obtained by selecting any combination of shims (Classes 1 − 5).

(18) Install shims as follows:

(a) Loosen bolts securing runners and install shims, as determined by previous step, under runner.

NOTE: Earlier synchronizing ring runner shims have bolt holes which require removal of runner bolts for insertion of shims, while newer configuration shims have slots which only require loosening of runner bolts for shim insertion.

(b) Use the PWA 87429 Torque Adapter and tighten and torque bolts to 45 − 55 lb−in. (5.084 − 6.214 N.m).

(c) Bend the tabs of the key washers with the PWA 102158 Crimper to safety the bolts. The long jaw of the Crimper must locate on the tab of the washer. Squeeze the Crimper handle to bend the tab of the washers.

Subtask 72−35−00−430−070:

(19) Install clevis assembly to Stage 7 ring at 3 o'clock location. Secure clevis with bolts, threads lubricated with Engine Oil P03−001, and key washers. Install ring plate with bolts, threads lubricated with Engine Oil P03−001, and key washers. Tighten and torque all bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend tabs to secure bolts.

(20) Move Stage 7 ring to vane open rig position. Install PWA 86197 Rigging Pin in ring to engage slot in bracket on case flange. Move ring back and forth to ensure ring is locked to case.

(21) (Reference 2104) Determine unision ring shim thickness. See Figure 1002.

(a) Insert shim stock or runner shims into radial clearance at four locations approximately 45 degrees either side of the axial flanges to prevent unison ring motion.

(b) Measure and record the remaining seven radial clearances between runners and Stage 7 ring.

(c) Remove, measure and record the four shim thicknesses from step (a).

(22) Average clearance by adding the 11 readings and divide by 11. Round off to three decimal places.

(23) Subtract desired radial clearance for this stage from average value. See Table 1001. The remaining value represents the shim thickness required at each runner location. Shim thickness may be obtained by selecting any combination of shims (Classes 1 − 5).

CAUTION: (PRE AND POST SB PW4ENG 72−366) RUNNER AND SHIM ARE INTERCHANGEABLE IN SETS. HOWEVER, SHIM (POST SB PW4ENG 72-366) MAY BE USED WITH RUNNER (PRE SB PW4ENG 72-366).

R (24) Install shims, single tab down and facing out, between runner bracket and case flange. Tighten and torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Repeat above procedure at 11 places.

NOTE: When securing runner, ensure shim(s) take on curvature of engine flange. Shim(s) must be tight against top of engine flange.

D. Postrequisites

(1) Install and rig HPC stator vane actuator and lever assembly. See Assembly-03 (Task 72-35-00-400-003).

Task 72-35-00-400-002-A:

2. Determine Runner Clearances (Asymetric Case Configuration)

A. Prerequisites

(1) Assemble high pressure compressor (HPC). See Assembly-01 (Task 72-35-00-400-001).

B. Equipment And Materials Necessary

Special Tools:

PWA 78232	Adapter, Pull Test
PWA 85108	Stand, Build
PWA 85393	Pin, Rigging (4 Necessary)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

C. Procedure

Subtask 72−35−00−430−096:
See Figure 1003 and Figure 1004.

NOTE: This procedure starts with the axial compressor rotor installed, front end down, in a PWA 85108 Build Stand, PWA 85537 Handling Fixture and PWA 85528 Handling Adapter. Tools PWA 85534 Fixture, PWA 88701 Retaining Nut, PWA 85536 Adapter, and a PWA 85530 Wrench are installed on the rear of the assembly.

(1) Install ten runners on each of the synchronizing rings, inlet, 5th, and 6th stages.

NOTE: The 7th stage runners are installed on Flange H.

(a) Loosely install the runners with key washers and bolts, threads lubricated with Engine Oil P03−001 on the synchronizing ring as shown. Refer to Figure 1001.

NOTE: Do not tighten the bolts. Shims must be installed in a later step when runner clearances are determined.

Seventh Stage Runner Clearance
Figure 1002
(Task 72−35−00−400−002)

(2) Install clevis assemblies to the inlet, 5th, 6th, and 7th stage synchronizing rings at the 3 o'clock position. Attach the clevis with bolts, threads lubricated with Engine Oil P03−001 and key washers. Install the two longer bolts at the raised pad locations on the clevis. Do not torque the bolts at this time.

(3) Install the inlet, 5th, 6th, and 7th stage HPC synchronizing ring plates at the 9 o'clock position with bolts, threads lubricated with Engine Oil P03−001 and key washers. Tighten and torque all bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Bend the tabs of the key washers to attach the bolts.

(4) Move the inlet, 5th, and 6th stage synchronizing rings to the open rig position. Install PWA 85393 Rigging Pin in the clevis bracket slot to engage the slot in the case. Try to move the synchronizing rings to make sure that the rings are locked to the case.

(5) Move the 7th stage synchronizing ring to the open rig position. For the 7th stage, install PWA 85393 Rigging Pin in the clevis bracket slot to engage the slot in the case. Try to move the ring to make sure that the ring is locked to the case.

(6) Determine the synchronizing ring runner shim thickness. See Figure 1003 and Figure 1004.

  (a) Put shim stock or runner shims into the radial clearance at four runner positions approximately 45 degrees either side of the axial flanges to prevent synchronizing ring movement.

  (b) Measure and write the radial runner clearances at the remaining six runner locations for the IGV, 5th, and 6th stages.

  (c) Measure and write the radial runner clearances for the remaining seven runner locations for the 7th stage.

  (d) Remove, measure, and write the first four shim thicknesses for each stage.

(7) For the seventh stage synchronizing ring, average the clearances by adding the seven runner clearances and the four shim thicknesses and divide by 11. Round off to three decimal places.

(8) For the IGV, 5th, and 6th stages synchronizing ring, average the clearances by adding the six runner clearances and the four shim thicknesses for each stage and divide by 10. Round off to three decimal places.

(9) Subtract the runner clearance given for each stage from the average value calculated in the previous steps. This value is the respective shim thickness required at each runner for each stage. See Table 1001.

Stage	Desired Runner Clearance
IGV	0.010 inch (0.254 mm)
5	0.010 inch (0.254 mm)
6	0.015 inch (0.381 mm)
7	0.015 inch (0.381 mm)

Desired Runner Clearance
Table 1001

R (10) Install the necessary number of shims, as follows:

R (a) Loosen the bolts that attach the runners and install the shims below the runners.

NOTE: The shim thickness can be found by the selection of different shim classes.

R (b) When you install the runner assemblies, make sure that the shim or shims are in the shape of the engine flange or the synchronizing ring applicable. Shims must be tight against the top of the engine flange or synchronizing ring.

R (c) For the IGV, 5th, and 6th stages, tighten and torque the bolts to 45 − 55 lb−in. (5.084 − 6.214 N.m).

R (d) For the 7th stage, tighten and torque the bolts to
R 36 − 40 lb−in. (4.067 − 4.519 N.m).

R (e) Bend the tabs of the key washers.

(11) After the shims are installed, the runner clearance must be as specified in Table 1002.

Variable Stator	Clearance − Inches (mm)
Inlet	0.009 − 0.013 (0.229 − 0.330)
5th	0.009 − 0.013 (0.229 − 0.330)
6th	0.014 − 0.018 (0.356 − 0.457)
7th	0.014 − 0.018 (0.356 − 0.457)

Runner To Synchronizing Ring Clearance
Table 1002

(12) Do the synchronizing ring pull test. See Figure 1006.

(a) Install a PWA 78232 Pull Test Adapter on the front case as follows:

1 Install the upper plate (1006/4) on the rear of Flange H (1006/1) at approximately the 2 o'clock position. Count all holes from the case split flange toward the 2 o'clock position and install the upper plate with bolts (1006/3) and nuts (1006/2) (boltheads down) in the 11th, 16th, and 17th holes.

2 Install the lower plate (1006/5) on the rear of Flange E at approximately the 2 o'clock position. Count all holes from the case split flange toward the 2 o'clock position and install the lower plate with bolts (1006/6) and nuts (1006/7) (boltheads up) in the 8th, 9th, and 10h holes.

NOTE: Make sure the shaft is parallel to the engine centerline.

3 Adjust the linkage arm (1006/9) so the ball lock pin engages the IGV synchroninzing ring clevis (1006/10).

NOTE: The pull test is done on the IGV, 5th, 6th, and 7th stage synchronizing rings starting with the IGV synchronizing ring.

4 Move the synchronizing ring (1006/11) until the vane arms are parallel to the engine axis.

5 Move the pointer to zero and tighten the swivel head screw (1006/8) to lock it in position.

6 Install a torque wrench in line with the pivot arm.

(b) Apply a tangental load to the synchronizing ring clevis (1006/10). The vanes must move through an minimum angle of 5 degrees but not more than 20 degrees. Use a torque wrench to apply the load in both directions, vanes closing and opening. The force to turn the vanes can be up to 100 lbs (45.36 kg) maximum. Refer to Table 1003 for the equivalent torque wrench values.

TO GET A MAXIMUM FORCE OF:	TORQUE WRENCH LENGTH	TORQUE WRENCH READING
100 LBS (45.36 kg)	16 Inches (406.400 mm)	244 LB−IN. (27.568 N.m)
100 LBS (45.36 kg)	18 Inches (457.200 mm)	248 LB−IN. (28.020 N.m)
100 LBS (45.36 kg)	21 Inches (533.400 mm)	254 LB−IN. (28.698 N.m)

Equivalent Torque Wrench Values
Table 1003

(c) Do the pull test again for the 5th, 6th, and 7th stage synchronizing rings.

(d) Remove mounting hardware and remove the PWA 78232 Pull Test Adapter from the HPC.

(13) Lift and turn the high pressure compressor (HPC) assembly.

(a) Attach a hoist to the (PWA 85534) fixture with a (PWA 88643 or PWA 88673) sling and two (PWA 76154) adapters.

(b) Attach another hoist to the (PWA 85537) Handling fixture with a (PWA 88643 or PWA 88673) sling and two (PWA 76154) adapters.

(c) Use the two hoists to lift the HPC from the (PWA 85108) stand.

(d) Turn the HPC so the front end is up and lower it so it rests on the (PWA 85534) fixture. Remove hoists, slings and adapters.

D. Postrequisites

(1) Install and rig HPC stator vane actuator and lever assembly. See Assembly-03 (Task 72-35-00-400-003).

(Task 72-35-00-400-002-A)

Task 72-35-00-400-003:

1. Install And Adjust The HPC Stator Vane Lever Assembly

A. Prerequisites

(1) Install synchronizing rings and determine runner clearances. See Assembly-02 (Task 72-35-00-400-002).

B. Equipment And Materials Necessary

Special Tools:

PWA 85395	Pin, Rigging (Pre SB PW4ENG 72-246)
PWA 86097	Pin, Rigging (Post SB PW4ENG 72-246)

NOTE: Rigging Pin Kit (PWA 85675) contains the above rigging pins.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	3	72-35-00/23/300

Lockwire, MS9226-06		
Lockwire, AS3214-03		

C. Procedure

See Figure 1001.

Subtask 72−35−00−430−058:

(1) Install compressor stator cylinder support brace to lugs on case, at approximately 3 o'clock location, with brace pointed downward. Secure brace with two bolts, threads lubricated with Engine Oil P03−001, and nuts. Tighten and torque nuts to 125 − 170 lb−in. (14.123 − 19.207 N.m). Install cotter pins to secure nuts. Secure cotter pins. See Standard Practices Manual, PN 585005, 70−53−00.

(2) Install the compressor stator cylinder support bracket to case upper half at approximately the 3 o'clock location. See Figure 1001 (Sheet 1), (Sheet 2), and (Sheet 4).

NOTE: See the following step for engines with the asymmetric HPC case

- (a) Apply Engine Oil P03−001 to the four bolts you will use to install the bracket.
- (b) Install the bracket to the case with the four lubricated bolts.
- (c) Tighten and torque the bolts to 180 − 200 lb−in. (20.337 − (22.597 N.m).

(3) For the asymmetric HPC case configuration, install the compressor stator cylinder support bracket (1001/14) to case upper half at approximately the 3 o'clock location. See Figure 1001 (Sheet 5).

- (a) Apply Engine Oil P03−001 to the four bolts (1001/13) you will use to install the bracket (1001/14).
- (b) Install the bracket (1001/14) to the case with four lubricated bolts (1001/13).
- (c) Tighten and torque bolts (1001/13) to 180 − 200 lb−in. (20.337 − (22.597 N.m).

Subtask 72−35−00−430−059:

(4) (Pre SB PW4ENG 72−534) Install the vane actuator and lever assembly as follows.

(a) Install vane actuator and lever assembly to case bracket and lugs. Install two studs to upper attaching points on actuation support. Lubricate threads with Engine Oil P03−001. Install two nuts to both sides and torque nuts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Secure nuts with four cotter pins. Secure cotter pins. See Standard Practices Manual, PN 585005, 70−53−00. For each upper attaching leg of the SVA support bracket, install lockwire through the cotter pin loop at one end of the stud, twist lockwire, wrap around the support upper leg, twist again and install through cotter pin loop at other end of the stud. See Figure 1001 (Sheet 7).

(5) (Post SB PW4ENG 72−534) Install the vane actuator and lever assembly as follows.

(a) (Reference 749) Install the vane actuator and lever assembly to the front compressor case bracket and lugs. Install two expandable studs (called studs) to upper attaching points on actuation support.

NOTE: Installation of the stud to the front attachment lug may require that the 5th stage unison ring be rotated so that the hole in the clevis is in line with the hole in the bracket and the lug of the front compressor case. This will allow the stud to pass through the hole in the clevis and into the bracket and the lug on the case.

(b) Lubricate the threads of the nuts with Engine Oil P03−001. Install a washer and a lubricated nut to each end of the studs. Center the studs so that an approximate equal length projects from the front and rear of the front compressor attachment points. Tighten the nuts fingertight.

(c) (Reference 739) Use a 3/32 inch (2.381 mm) hexagonal wrench in the end of the stud to prevent rotation during the torque process. Alternately torque each nut approximately one−half turn until a torque of 55 − 70 lb−in. (6.214 − 7.909 N.m) is obtained and a slot in the nuts is aligned with the cotter pin hole in the studs.

(d) After final torque of the nuts, do an inspection to ensure the following:

  1 That a gap exists between the washer and the front compressor attachment points on one or both sides. Replace the stud if the total gap is less than 0.005 inch (0.127 mm). Total gap is the gap at both ends added together, or if only one gap, a gap at either end. See Figure 1001 (Sheet 8).

  2 That the cotter pin holes are located entirely in the slot of the nuts.

  3 That the stud end projection is approximately equal, at both ends, plus or minus one thread beyond the outboard end of each nut.

(e) Install a cotter pin to secure each nut. Secure four cotter pins. See Standard Practices Manual, PN 585005, 70−53−00.

(f) Install two bolts to secure actuation support lower attaching flange to case lugs. Lubricate bolt threads with Engine Oil P03−001.

  1 (Pre SB PW4ENG 72−246 and SB PW4ENG 72−289) Install the forward bolt with the bolthead pointing up. Install the rearward bolt with the bolthead pointing down. Install the nuts to the bolts and torque the nuts to 125 − 170 lb−in. (14.123 − 19.207 N.m). Install MS9226−06 lockwire through each castellated nut and wire hole in the bolt threads. Twist the lockwire and wrap around the support and twist again. See Figure 1001 (Sheet 2) and Figure 1001 (Sheet 3).

  NOTE: This will prevent the bolts from turning.

  2 (Post SB PW4ENG 72−246 and SB PW4ENG 72−289). Install the bolts with the boltheads pointing down. Install spacers (next to nuts) and nuts to the bolts. Torque the nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m). See Figure 1001 (Sheet 2) and Figure 1001 (Sheet 3).

(g) (For engines with the asymmetric high compressor case) Attach the lower two points of the support bracket to the HPC case lugs as follows: Figure 1001 (Sheet 5).

1 Apply Engine Oil P03-001 to the threads of two bolts (1001/10). Install the two lower bolts with the heads downward.

2 Install two spacers (1001/9) over the two bolts (1001/10) and into the bracket and attach in position with two nuts (1001/8), tightened hand tight only.

3 Torque the two nuts (1001/8) 180 - 200 lb-in. (20.337 - 22.597 N.m).

(h) (Reference 618) Install engine rear end of compressor stator cylinder support bracket (antisway brace) as follows. For (Post SB PW4ENG 72-483) only, install 0 - 12 shim washers (two sides), to get a fit of 0.008L - 0.008T inch (0.203L - 0.203T mm). After shimming, torque the nut to 50 - 80 lb-in. (5.649 - 9.039 N.m). Safety the nut with a cotter pin. Refer to Standard Practices Manual, PN 585005, 70-53-00.

NOTE: To get the correct fit (Reference 618) 0.008L - 0.008T inch (0.203L - 0.203T mm) you must have incorporated SB PW4ENG 72-246 or SB PW4ENG 72-289.

(i) (Reference 618) (Post SB PW4ENG 72-483) Install engine front end of compressor stator cylinder support bracket (anti-sway brace) as follows. Install bolt through support and brace with washer between support and bolt head. Measure gap between support and brace and install 0 - 8 shim washers to get a fit of 0.008L - 0.008T inch (0.203L - 0.203T mm) after shimming, lubricate bolt threads with Engine Oil P03-001, assemble nut on bolt and torque the nut to 50 - 80 lb-in. (5.649 - 9.039 N.m). R

(j) (For engines with the asymmetric high compressor case) Attach the brace (1001/2) to the support bracket and the boss on the HPC case as follows. See Figure 1001 (Sheet 5).

1 Apply Engine Oil P03−001 to the threads of the four bolts (1001/1, (1001/3) and (1001/7)).

2 Attach the rear leg of the brace to the support bracket as follows:

  a Install the rear (hex head) bolt (1001/7), bolt head forward next to the brace (1001/2) and a thin washer (1001/6) between the brace and the support bracket.

  b Push the bolt rearward until the bolt head touches the brace.

  c Install approximately six thin washers (1001/6) next to the support, one thicker washer (1001/5) and the nut (1001/11), hand tight only.

3 Attach the front leg of the brace to the support bracket as follows:

  a Install the front (double hex head) bolt (1001/1), bolt head rearward next to the front leg of the brace (1001/2) and install approximately six thin washers (1001/6) between the brace and the support bracket.

  b Push the bolt forward until the bolt head touches the brace.

  c Attach the brace to the support bracket with a thick washer (1001/5), next to the support bracket, and a nut (1001/4), hand tight only.

4 Attach the brace to the boss on the HPC case with bolts (1001/3) hand tight only.

5 Torque the bolts (1001/3) that attach the brace to the HPC case to 85 − 95 lb−in. (9.604 − 10.734 N.m).

6 (Reference 618) Torque the nuts (1001/4 and 1001/11) and bolts (1001/1 and 1001/7) which attach the brace to the support bracket as follows:

R
R

a Tighten the nut (1001/11) on the rear (hex head) bolt until the cotter pin hole in the bolt is visible in the slots in the nut and permits a cotter pin (1001/12) to be installed.

b Install the cotter pin (1001/12).

NOTE: Do not bend the cotter pin legs.

c While you hold the head of the rear (hex head) bolt (1001/7) against the brace (1001/2), measure the gap between the support bracket and the brace at the two thin washer (1001/6) locations, Gap A and Gap B. See Figure 1001 (Sheet 6).

d With the rear (hex head) bolt (1001/7) head still against the brace, measure the gap between the support bracket and the face of the nut (1001/11) Gap C.

e Add or subtract thin washers (1001/6), as necessary, to obtain a stack of washers that are in the gap limits of 0.008L − 0.008T inch (0.203L − 0.203T mm) at the three thin washer locations.

NOTE: The thin washers (1001/6) are 0.015 − 0.018 inch (0.381 − 0.457 mm) thick.

f These limits must be met on both sides of the rear bolt (1001/7) and between the brace (1001/2) and the support on the front bolt (1001/1).

g Remove the cotter pin (1001/12) from the rear nut (1001/11) and torque the nut to 50 − 80 lb−in. (5.649 − 9.039 N.m).

NOTE: Align the slot in the nut with the holes in the bolt while you torque.

h Install the cotter pin (1001/12) to safety the rear nut (1001/11).

i Bend the cotter pin (1001/12) legs so that the head and the upper leg are seated against the bolt and the lower leg is seated against the nut flat.

j Torque the front bolt (1001/1) to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Subtask 72−35−00−430−060:

(6) Adjust the unison ring linkage as follows.

CAUTION: INCORRECT RIGGING OF THE STATOR VANE CONTROL SYSTEM CAN CAUSE TOO MUCH STRESS ON THE ENGINE COMPONENTS.

CAUTION: REFER TO SB PW4ENG 72−246 FOR THE APPLICABLE TOOL PART NUMBER FOR RIGGING THE VARIABLE STATOR VANE CONTROL.

(a) Use a standard crowsfoot wrench and rotate lever assembly to align slot in rigging plate with hole in lever support. For engines with the larger rigging slot (Pre SB PW4ENG 72−246), insert PWA 85395 Pin to lock lever assembly in vane open rig position. For engines with the smaller rigging slot (Post SB PW4ENG 72−246), insert PWA 86097 Pin to lock the lever assembly in vane open rig position.

(b) With lever assembly and unison rings pinned in vane open position, turn adjusters so that holes in rod end bearing and clevis will line up. Install bolt to each clevis to secure rod end bearing. Check for adequate thread engagement by inserting wire into linkage inspection holes at both ends of linkage. If wire does not go through linkage at both ends, lock rod ends by torquing jamnuts on linkage to 115 − 150 lb−in. (12.993 − 16.948 N.m). Bend one set of key washer tabs onto adjuster and other set onto jamnuts.

(c) If wire does go through linkage inspection holes at either end, readjust adjuster until wire does not go through at both ends. Lock rod ends by torquing jamnuts on linkage to 115 − 150 lb−in. (12.993 − 16.948 N.m). Bend one set of key washer tabs onto adjuster and other set onto jamnuts. Seal rod ends.

(d) (Pre SB PW4ENG 72-506) (Reference 730) Install washers to Stages IGV, 5 and 7 clevis bolts. Lubricate threads of bolts with Engine Oil P03-001. Install nuts to all four stages and torque nuts to 15 - 22 lb-in. (1.695 - 2.486 N.m) in addition to torque required to turn bolt through nut. Secure with cotter pins. Bend cotter pins. See Standard Practices Manual, PN 585005, 70-53-00.

(e) (Post SB PW4ENG 72-506) (Reference 730) Lubricate threads of bolts with Engine Oil P03-001. Install nuts to all four stages and torque nuts to 15 - 22 lb-in. (1.695 - 2.486 N.m) in addition to torque required to turn bolt through nut. Secure with cotter pins. Bend cotter pins. See Standard Practices Manual, PN 585005, 70-53-00.

(f) Remove all rig pins.

D. Postrequisites

(1) Rig the compressor stator vane control system. See72-35-62-440-001, Special Procedure-05 Task 72-35-62-440-001 or Task 72-35-62-440-001.

(2) Install HPC external parts. See Assembly-04 Task 72-35-00-400-004.

Task 72-35-00-400-004:

1. Install HPC External Parts

A. Prerequisites

(1) Install and rig HPC stator vane actuator and lever assembly. See Assembly-03 Task 72-35-00-400-003.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85436 Torque Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
R P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	2	72-35-00/30/250
Cotter Pin	1	79-21-00/5/80
Gasket	1	75-22-00/1/1
Gasket	2	75-24-00/1/1

Packing	3	79-21-00/5/30
Packing	1	79-21-00/5/190
Packing	1	79-21-00/5/170
Packing	1	79-21-00/5/10

C. Procedure

Subtask 72−35−00−430−061:

(1) Install brackets to the HPC front and rear cases as follows. See Figure 1001.

(a) Attach the fuel/oil cooler brackets to the HPC front and rear cases with the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(b) Attach the remainder of the HPC front case brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(c) Attach the bracket to the top of the HPC rear case with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(d) Attach the two gearbox support brackets and a bracket (Post SB PW4ENG 75−95) to the HPC rear case with eight bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Make sure the bearings are installed in the gearbox driveshaft housing support link. Install the support link and attach it with the two bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m). Install the cotter pins. Lockwire the bolt heads to the gearbox support bolt heads. Temporarily attach lower bearing to link with lockwire.

(2) Install the Flange J hardware as follows. Refer to 72−350−00, Assembly−20 (Task 72−35−00−430−020).

Subtask 72−35−00−430−071:

(3) Install turbine case cooling air valve actuator to bracket at 2 o'clock position on front HPC case. See Figure 1002. Ensure bracket pins engage holes in actuator slide rails. Secure with four clamps and bolts, threads lubricated with Engine Oil P03−001. For engines not equipped with nut plates and bracket

riveted to support (Pre SB PW4ENG 75-35), install loop clamp bracket and four nuts. Torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(a) (Reference 736) Install bracket and ground cable to rear of actuator bracket and secure with two bolts, threads lubricated with Engine Oil P03-001, and nuts handtight only.

NOTE: The two bolts that attach the bracket and cable to the actuator bracket will be torqued after the installation of the bleed valve supply tubes (AA24), (AA28), and (AA30). See 72-00-35, Installation-03 Task 72-00-35-420-002.

(b) Install bolt securing ground cable to actuator and torque to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: For engines equipped with the longer ground cable (Pre SB PW4ENG 75-31), the ground cable is attached above the support, under the bolthead.

NOTE: Ensure actuator slides on rails from front to rear without interference.

Subtask 72-35-00-430-062:

(4) Install the No. 3 bearing cooling air elbow as follows.

NOTE: See PW4ENG 72-244 for the correct No. 3 bearing cooling air elbow to be used with the No. 3 bearing front cooling duct assembly.

(a) Install the new gasket to the opening on the HPC rear case behind Flange J and at approximately 5 o'clock position. Apply Paraffin Wax P05-059 to hold the gasket in place. Install the elbow with the threaded opening to the front and attach with the four bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Do not loosen the bolts. Torque the bolts again to the same limit until the torque is held. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(b) Install the washer and adapter, threads lubricated with Engine Oil P03−001. Torque the adapter to the elbow to 450 − 550 lb−in. (50.843 − 62.142 N.m).

Subtask 72−35−00−430−063:

(5) Install the fuel/oil cooler as follows. See Figure 1003.

(a) Put the cooler on a bench with the bolted end to the left. Remove all the protective closures.

(b) Install the oil cooler bypass valve with the gasket, lubricated with Engine Oil P03−001. The electrical connectors must be to the right. Attach the valve with the four bolts, threads lubricated with Engine Oil P03−001, and washers. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(c) Install the packings, plug, and adapters to the oil bypass valve as follows.

1 Install the packings, lubricated with Engine Oil P03−001, to the plug and adapters. Lubricate the threads of the plug and adapters with Engine Oil P03−001.

2 Install the adapter (1004/1) and torque to 375 − 425 lb−in. (42.369 − 48.019 N.m).

3 Install the plug (1003/2) and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

4 Install the adapter (1003/3) and torque to 650 − 750 lb−in. (73.440 − 84.739 N.m).

5 Install the adapter (1003/4) and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(d) Install the packings, plugs and adapters to the cooler as follows.

1 Install the packings, lubricated with Engine Oil P03−001, to the plugs and adapters. Lubricate the threads of the plugs and adapters with Engine Oil P03−001.

2 Install three adapters (1003/5) to each end of the cooler. Torque the adapters to 650 − 750 lb−in. (73.440 − 84.739 N.m).

3 Install the adapter (1003/6) to the port on the front of the cooler. Torque the adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m).

4 Install the elbow (1003/8) to the angled port on the front of the cooler. Tighten the elbow handtight only. Torque the elbow when the airframe drain tube is installed.

5 Install the plug (1003/9) to the open port closet to the fuel inlet port. Torque the plug to 375 − 426 lb−in. (42.369 − 48.019 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

6 Install the two plugs (1003/10) to the remaining two ports. Torque the plugs to 110 − 120 lb−in. (12.482 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Remove the four bolts and washers that will attach the two brackets to the front of the cooler. Attach the brackets to the cooler with the same four bolts. Do not use the washers when the brackets are installed. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) For engines without the front split mount bracket (Pre SB PW4ENG 79−20), install the pin, threads lubricated with Engine Oil P03−001, washer, and nut to front ear of cooler. Torque the nut to 550 − 750 lb−in. (62.142 − 84.739 N.m) and align the cotter pin hole. Install the cotter pin. Install the cooler to the engine and engage the pin to the front mount bracket bearing. Attach the rear of the cooler with one loop clamp bracket, three washers, and four bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

(g) For engines with the front split mount bracket (Post SB PW4ENG 79−20), install the bracket retainer, the pin, threads lubricated with Engine Oil P03−001, washer, and nut. Torque the nut to 550 − 750 lb−in. (62.142 − 84.739 N.m) and align the cotter pin hole. Install the cotter pin. Install the front oil cooler bracket to the pin and engage the retainer. Install the cooler to the engine. Attach the front mount with two R bolts, threads lubricated with Antiseize Paste R P06−054. Wipe off unwanted paste. Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m). Install the loop clamp bracket, three washers, and four bolts, threads lubricated with Engine Oil P03−001, that attach the rear of the cooler. Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Subtask 72−35−00−430−064:

(6) Install the left and right 9th stage start/stability (2.9) bleed valves. See Figure 1004.

(a) Install a gasket on the tube adapter for each bleed valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapters to the valves and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

CAUTION: WHEN YOU USE THE PWA 85436 TORQUE ADAPTER, THE TORQUE WRENCH INDICATION IS LESS THAN THE CORRECT TORQUE. SEE STANDARD TORQUES IN THE STANDARD PRACTICES MANUAL.

(b) Install a gasket to each opening on the HPC rear case at 10 o'clock and 1 o'clock positions. Install and attach each bleed valve and brackets with eight bolts, threads lubricated with Engine Oil P03−001. Use PWA 85436 Torque Adapter to tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held.

(c) If equipped remove the protection cover from the boss on the side of each bleed valve. Install the cover to the boss and attach with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

Subtask 72−35−00−430−065:

(7) Install the left and right turbine vane and blade cooling air valves. See Figure 1005.

(a) Install a gasket on the tube adapter for each cooling air valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapters to the valves and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket location on the valve.

(b) (Pre SB PW4ENG 75−147) Install a gasket to each opening on the HPC rear case at 10 o'clock and 3 o'clock positions. Apply Paraffin Wax P05−059 to hold the gaskets in position. Install and attach each cooling air valve and brackets with seven bolts, threads lubricated with Engine Oil P03−001. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held. See Figure 1005.

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket location on the valve.

(c) (Post SB PW4ENG 75−147) Install a gasket to each opening on the HPC rear case at 10 o'clock and 3 o'clock positions. Apply Paraffin Wax P05−059 to hold the gaskets in position. Install and attach each cooling air valve and brackets with seven bolts, threads lubricated with Engine Oil P03−001. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held. See Figure 1005 (Sheet 1) and Figure 1005 (Sheet 2).

NOTE: Ring case configuration compressor (SB PW4ENG 72−756 or SB PW4ENG 72−759) has a foolproofing pin on the valve flange to prevent (Pre SB PW4ENG 75−147) valves installed on (RCC) compressor.

(d) If valve has the position switch, position turbine vane and blade cooling air valve position switch to turbine vane and blade cooling air valve aligning bolt holes for proper positioning. See Figure 1005.

NOTE: (Post SB PW4ENG 75−107) and (Post SB PW4ENG 72−756) engines do not have a position switch.

(e) Secure position switch to valve with bolts, threads lubricated with Engine Oil P03−001. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(f) Remove protective closures. Connect W4P21 harness connector to connector on position switch.

CAUTION: ENSURE SPECIFIED TORQUE WRENCH READING IS ADHERED TO. INCORRECT CONNECTOR TORQUE COULD RESULT IN CONNECTOR DAMAGE AND INADEQUATE LIGHTNING PROTECTION.

1 (Reference 2156) Tighten and torque connector to 30 − 35 lb−in. (3.390 − 3.954 N.m) and secure with lockwire.

(g) (Reference 760) If necessary, remove the shipping cotter pin and tag from the face of the switch.

Subtask 72−35−00−430−066:

(8) Install left and right HPC secondary−flow control valves. See Figure 1006.

NOTE: (Post SB PW4ENG 72−756) engines do not have the left and right HPC secondary flow control valve.

(a) Install a gasket on the plug for each control valve. Lubricate the plug threads with Engine Oil P03−001. Install the plug and gasket to the opening of each valve as shown in the figure. Torque the plugs to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(b) Install a gasket on the tube adapter for each control valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapter and gasket to the opening of each valve as shown in the figure. Torque the adapters to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(c) Install a cap assembly (Pre SB PW4ENG 75−85), threads lubricated with Engine Oil P03−001, onto the adapter. Torque the cap assembly to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to the cap assembly.

(d) Install the vented cover to the port adjacent to the plug (with the drilled vent holes towards the mounting flange) on each valve. Install the bracket (Post SB PW4ENG 72−211 only) with the vented cover on the left valve as shown in the figure. Attach each vented cover and bracket with three bolts, lubricated with Engine Oil P03−001. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 cover bolts which have provisions.

(e) Install a gasket to each opening on the HPC rear case at 2:20 o'clock and 9:30 o'clock positions. Apply Paraffin Wax P05−059 to hold the gaskets in position. Install and attach each control valve with six bolts, the threads lubricated with Engine Oil P03−001. Install a bracket (Post SB PW4ENG 79−52) to the lower flange of the left side secondary flow control valve. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held.

Subtask 72−35−00−430−072:

(9) Install two filters to Flange J bracket at approximately 2 o'clock position with bolts, threads lubricated with Engine Oil P03−001, and nuts. See Figure 1007. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(10) Install two filters to Flange J bracket approximately 11 o'clock position with bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

Subtask 72−35−00−430−073:

(11) Install brackets to compressor stator cylinder support assembly with bolts, threads lubricated with Engine Oil P03−001, washers, and nuts. See Figure 1008. Torque bolts (1008/1), (1008/2), (1008/3), and (1008/5) to 85 − 95 lb−in. (9.604 − 10.734 N.m). Torque bolts (1008/4) to 180 − 200 lb−in. (20.337 − 25.597 N.m). Torque bolts (1008/6) and (Post SB PW4ENG 73−63) bolts (1008/7) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Do not torque (1008/5) bolts until installation of fuel flowmeter.

Subtask 72−35−00−430−074:

(12) Locate two hole boss on HPC front case approximately 12 inches (304.800 mm) from front leading edge and at approximately 2 o'clock location. Install two bolts, threads lubricated with Engine Oil P03−001. Tighten and torque bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m). Refer to Figure 1001 (Sheet 1).

(13) If engine has the ring case configuration, make sure the identification plate has the "RC" after the serial number. The HPC rotor and stator identification plate is located on Flange J at approximately 2:30 o'clock position. See Figure 1009.

HIGH PRESSURE COMPRESSOR (HPC) - ASSEMBLY-04

Task 72-35-00-400-006:

1. Install HPC External Parts

A. Prerequisites

(1) Install and rig HPC stator vane actuator and lever assembly. See Assembly-03 Task 72-35-00-400-003.

B. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 85436 Torque Adapter

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-059	Wax, Paraffin (PMC 9552)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P06-002	Petrolatum White (PMC 9609)
R P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Cotter Pin	2	72-35-00/30/250
Cotter Pin	1	79-21-00/5/80
Gasket	1	75-22-00/1/1
Gasket	2	75-24-00/1/1
Gasket	1	79-21-00/6/1
Packing	3	79-21-00/5/30
Packing	1	79-21-00/5/190
Packing	1	79-21-00/5/170
Packing	1	79-21-00/5/10

C. Procedure

HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−04

Subtask 72−35−00−430−085:

(1) Install the brackets to the HPC front and rear cases as follows. See Figure 1001.

- (a) Attach the fuel/oil cooler brackets to the HPC front and rear cases with the bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).
- (b) Attach the remaining HPC front case brackets with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).
- (c) Attach the bracket to the top of the HPC rear case with two bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).
- (d) Attach the two gearbox support brackets and a bracket to the HPC rear case with eight bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Safety the bolts with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.
- (e) Make sure the bearings are installed in the gearbox driveshaft housing support link. Install the support link and attach it with the two bolts, threads lubricated with Engine Oil P03−001, and nuts. Torque the nuts to 180 − 200 lb−in. (20.337 − 22.597 N.m). Install the cotter pins. Safety the bolt heads to the gearbox support bolt heads with lockwire. Temporarily attach the lower bearing to the link with lockwire.

(2) Install the Flange J hardware. Refer to 72−35−00, Assembly−20 (Task 72−35−00−430−020).

Subtask 72-35-00-430-086:

(3) Install the turbine case cooling air valve actuator to the bracket at the 2 o'clock position on the front HPC case. See Figure 1002. Make sure the bracket pins engage the holes in the actuator slide rails. Attach with four clamps and bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(a) (Reference 736) Install bracket and ground cable to rear of actuator bracket and attach with two bolts, threads lubricated with Engine Oil P03-001, and nuts handtight only.

NOTE: The two bolts that attach the bracket and cable to the actuator bracket are torqued after the installation of the bleed valve supply tubes (AA24), (AA28), and (AA30). See 72-00-35, Installation-03 Task 72-00-35-420-002.

(b) Install the bolt that attaches the ground cable to the actuator and torque the bolt to 85 - 95 lb-in. (9.604 - 10.734 N.m).

NOTE: Make sure the actuator moves easily on the rails from the front stop to the rear stop without interference.

Subtask 72-35-00-430-087:

(4) Install the No. 3 bearing cooling air elbow as follows. See Figure 1002.

(a) Install the new gasket to the opening on the HPC rear case behind Flange J and at approximately the 5 o'clock position. Apply Paraffin Wax P05-059 to hold the gasket in place. Install the elbow with the threaded opening to the front and attach with the four bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Do not loosen the bolts. Torque the bolts again to the same limit until the torque is held. Safety the bolts with Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292.

(b) Install the washer and adapter, threads lubricated with Engine Oil P03−001. Torque the adapter to the elbow to 450 − 550 lb−in. (50.843 − 62.142 N.m).

Subtask 72−35−00−430−088:

(5) Install the fuel/oil cooler as follows. See Figure 1003.

(a) Put the cooler on a bench with the bolted end to the left. Remove all the protective closures.

(b) Install the oil cooler bypass valve with the gasket, lubricated with Engine Oil P03−001. The electrical connectors must be to the right. Attach the valve with the four bolts, threads lubricated with Engine Oil P03−001, and washers. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(c) Install the packings, plug, and adapters to the oil bypass valve as follows.

1 Install the packings, lubricated with Engine Oil P03−001, to the plug and adapters. Lubricate the threads of the plug and adapters with Engine Oil P03−001.

2 Install the adapter (1003/1) and torque to 375 − 425 lb−in. (42.369 − 48.019 N.m).

3 Install the plug (1003/2) and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

4 Install the adapter (1003/3) and torque to 650 − 750 lb−in. (73.440 − 84.739 N.m).

5 Install the adapter (1003/4) and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(d) Install the packings, plugs and adapters to the cooler as follows.

1 Install the packings, lubricated with Engine Oil P03−001, to the plugs and adapters. Lubricate the threads of the plugs and adapters with Engine Oil P03−001.

2 Install three adapters (1003/5) to each end of the cooler. Torque the adapters to 650 − 750 lb−in. (73.440 − 84.739 N.m).

3 Install the adapter (1003/6) to the port on the front of the cooler. Torque the adapter to 110 − 120 lb−in. (12.428 − 13.558 N.m).

4 Install the plug (1003/8) to the angled port on the front of the cooler. Torque the plug to 110 − 120 lb−in. (12.428 − 13.558 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

5 Install the plug (1003/9) to the open port closet to the fuel inlet port. Torque the plug to 375 − 426 lb−in. (42.369 − 48.019 N.m). Safety the plug with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

6 Install the two plugs (1003/10) to the remaining two ports. Torque the plugs to 110 − 120 lb−in. (12.482 − 13.558 N.m). Safety the plugs with Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292.

(e) Remove the four bolts and washers that will attach the two brackets to the front of the cooler. Attach the brackets to the cooler with the same four bolts. Do not use the washers when the brackets are installed. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Install the bracket retainer, pin, threads lubricated with Engine Oil P03−001, washer and nut to the front ear of the cooler. Torque the nut to 550 − 750 lb−in. (62.142 − 84.739 N.m) and align the cotter pin hole. Install the cotter pin. Install the front oil cooler bracket to the pin and engage the retainer.

(g) Install the cooler to the engine. Attach the front mount with two bolts, threads lubricated R with Antiseize Paste P06−054. Wipe off unwanted R paste. Torque the bolts to 125 − 140 lb−in. (14.123 − 15.818 N.m). Install the loop clamp bracket, three washers, and four bolts, threads lubricated with Engine Oil P03−001, that attach the rear of the cooler. Torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m).

Subtask 72−35−00−430−089:

(6) Install the left and right 9th stage start/stability (2.9) bleed valves. See Figure 1004.

(a) Install a gasket on the tube adapter for each bleed valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapters to the valves and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

CAUTION: WHEN YOU USE THE PWA 85436 TORQUE ADAPTER, THE TORQUE WRENCH INDICATION IS LESS THAN THE CORRECT TORQUE. SEE STANDARD TORQUES IN THE STANDARD PRACTICES MANUAL, PN 585005.

(b) Install a gasket to each opening on the HPC rear case at the 10 o'clock and 1 o'clock positions. Install and attach each bleed valve and brackets with eight bolts, threads lubricated with Engine Oil P03−001. Use PWA 85436 Torque Adapter to tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held.

(c) Install the bracket and thermocouple probe, as shown to each valve. Attach each probe with two bolts, lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(d) Remove the protection cover from the boss on the side of each bleed valve. Install the cover to the boss and attach with bolts, threads lubricated with Engine Oil P03−001. Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

Subtask 72−35−00−430−090:

(7) (Pre SB PW4ENG 75−147) Install the left and right turbine vane and blade cooling air valves. See Figure 1005.

(a) Install a gasket on the tube adapter for each cooling air valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapters to the valves and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket location on the valve.

(b) Install a gasket to each opening on the HPC rear case at the 10 o'clock and 3 o'clock positions. Apply Paraffin Wax P05−059 to hold the gaskets in position. Install and attach each cooling air valve and brackets with seven bolts, threads lubricated with Engine Oil P03−001. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held.

(8) (Post SB PW4ENG 75−147) Install the left and right turbine vane and blade cooling air valves. See Figure 1005 (Sheet 2) and Figure 1005 (Sheet 3).

(a) Install a gasket on the tube adapter for each cooling air valve. Lubricate the adapter threads with Engine Oil P03−001. Install the adapters to the valves and torque to 110 − 120 lb−in. (12.428 − 13.558 N.m).

NOTE: There are seven bolts which attach the valve to the case; Make sure you use the longer bolts for the bracket location on the valve.

(b) Install a gasket to each opening on the HPC rear case at the 10 o'clock and 3 o'clock positions. Apply Paraffin Wax P05−059 to hold the gaskets in position. Install and attach each cooling air valve and brackets with seven bolts, threads lubricated with Engine Oil P03−001. Tighten and torque the bolts to 85 − 95 lb−in. (9.604 −

10.734 N.m). Do not loosen the bolts. Torque again to the same limit until torque is held.

NOTE: Ring case configuration compressor (SB PW4ENG 72-756 or SB PW4ENG 72-759) has a foolproofing pin on the valve flange to prevent (Pre SB PW4ENG 75-147) valves installed on (RCC) compressor.

Subtask 72-35-00-430-091:

(9) Install the turbine vane cooling air valve to the HPC case. See Figure 1005.

(a) Install a gasket on the tube adapter for the cooling air valve. Lubricate the adapter threads with Engine Oil P03-001. Install the adapter to the valve and torque to 110 - 120 lb-in. (12.428 - 13.558 N.m).

(b) Install a gasket to the port on the HPC rear case at the 2:30 o'clock position. Apply Paraffin Wax P05-059 to hold the gasket in position. Install and attach the cooling air valve and bracket with six bolts, threads lubricated with Engine Oil P03-001. Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Do not loosen the bolts. Torque the bolts again to the same limit until the torque is held.

Subtask 72-35-00-430-092:

(10) Install the left and right HPC case covers. See Figure 1006.

(a) Install a gasket to each cover.

(b) Install a cover with a bracket to the opening in the HPC rear case at approximately the 3:30 o'clock position. Attach the cover with six bolts, threads lubricated with Engine Oil P03-001.

(c) Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Do not loosen the bolts, torque the bolts again until the 85 - 95 lb-in. (9.604 - 10.734 N.m) is held.

(d) Install a cover with a bracket to the opening in the HPC rear case at approximately the 9:30 o'clock position. Attach the cover with six bolts, threads lubricated with Engine Oil P03−001.

(e) Torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Do not loosen the bolts, torque the bolts again until the 85 − 95 lb−in. (9.604 − 10.734 N.m) is held.

Subtask 72−35−00−430−093:

(11) Install two filters to the Flange J bracket at approximately the 2 o'clock position with bolts, threads lubricated with Engine Oil P03−001 and nuts. See Figure 1007. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(12) Install two filters to Flange J bracket at approximately the 11 o'clock position with bolts, threads lubricated with Engine Oil P03−001 and nuts. See Figure 1007. Torque the bolts to 36 − 40 lb−in. (4.067 − 4.519 N.m).

Subtask 72−35−00−430−094:

(13) Install brackets to compressor stator cylinder support. Attach with bolts, lubricated with Engine Oil P03−001, and nuts. See Figure 1008. Torque bolts (1008/1), (1008/2), (1008/3), and (1008/5) to 85 − 95 lb−in. (9.604 − 10.734 N.m). Torque bolts (1008/4) to 180 − 200 lb−in. (20.337 − 25.597 N.m). Torque bolts (1008/6) to 36 − 40 lb−in. (4.067 − 4.519 N.m).

NOTE: Do not torque (1008/4) bolts until installation of the fuel flowmeter.

Subtask 72−35−00−430−095:

(14) Locate the two hole boss on HPC front case approximately 12 inches (304.800 mm) from front leading edge and at approximately the 2 o'clock position. Install two bolts threads lubricated with Engine Oil P03−001. Tighten and torque the bolts to 180 − 200 lb−in. (20.337 − 22.597 N.m). Refer to Figure 1001 (Sheet 1).

(15) If engine has the ring case configuration, make sure the identification plate has the "RC" after the serial number. The HPC rotor and stator identification plate is located on Flange J at approximately 2:30 o'clock position. See Figure 1009.

Task 72-35-00-400-005:

1. Pre-Assemble High Pressure Compressor (HPC) Stators And Rear Cases

A. Prerequisites

(1) Assemble Stages 11 and 12 compressor stator set, shroud sets, and springs. See 72-35-61, Assembly-01 Task 72-35-61-440-001.

(2) Assemble Stages 13 and 14 compressor stator set, shroud sets, and springs. See 72-35-62, Assembly-01 Task 72-35-62-440-001.

B. Equipment And Materials Required

Special Tools:

PWA 29855-6	Pin, Aligning (3 Required)
PWA 86572	Gage, ID - 8th Stage Rubstrip
PWA 86573	Gage, ID - 9th Stage Rubstrip
PWA 86574	Gage, ID - 10th Stage Rubstrip
PWA 86575	Gage, ID - 11th Stage Rubstrip
PWA 86576	Gage, ID - 12th Stage Rubstrip
PWA 86577	Gage, ID - 13th Stage Rubstrip
PWA 86578	Gage, ID - 14th Stage Rubstrip
PWA 86579	Gage, ID - 15th Stage Rubstrip
PWA 86581	Ring, Constraint - HPC Rear Case, Rear Flange
PWA 86582	Ring, Constraint - HPC Rear Case, Front Flange
PWA 86668	Fixture, HPC Stator Support (Optional)

Consumable Materials:

	Item No.	Designation
R	P03-001	Oil, Engine (PWA 521B)

C. Procedure

Subtask 72-35-00-430-076:

(1) Position the Stage 8 compressor stator set so that gangnut flange is up, Stage 8 borescope port is correctly positioned at about the 4:00 o'clock location and the stator set split centerline is at 12:00 and 6:00 o'clock. Secure stator segments together with eight bolts (heads to assemblers left), threads

lubricated with Engine Oil P03−001 and nuts. Tighten and torque nuts to 85 − 95 lb−in. (9.604 − 10.734 N.m). See Figure 1001.

Subtask 72−35−00−430−077:

(2) Install the Stages 9 and 10 stator set to rest on the Stage 8 stator, gangnut flange up, with stator split centerline at 1:30 and 7:30 o'clock locations and the Stage 10 borescope port at about the 7:00 o'clock location. Secure stator segments together with 10 bolts (heads to assemblers left), threads lubricated with Engine Oil P03−001 and nuts. Tighten and torque bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). See Figure 1001.

(3) Secure the Stages 9 and 10 stator to the Stage 8 stator with 40 bolts, threads lubricated with Engine Oil P03−001. Tighten and torque bolts, using an alternating pattern, 36 − 40 lb−in. (4.067 − 4.519 N.m).

Subtask 72−35−00−430−078:

CAUTION: THE 11TH AND 12TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72−396) MUST BE USED WITH THE 12TH AND 13TH STAGE ALUMINUM COATED BLADE TIPS (SB PW4ENG 72−395).

(4) Install one quarter section of the Stages 11 and 12 stator (stepped end down) into groove and anti−rotation feature in upper flange of the Stages 9 and 10 stator. Install a second quarter section to butt against previously installed section. Complete assembly of stator until all four sections are installed. See Figure 1002.

(5) Align splits in the Stages 11 and 12 stator set to be 45 degrees on either side of the 6 o'clock location. Align bolt holes with those in the Stages 9 and 10 stator. Make sure the Stage 12 borescope port is positioned at about the 3:00 o'clock location.

CAUTION: THE 13TH AND 14TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72−396) MUST BE USED WITH THE 14TH AND 15TH STAGE ALUMINUM OXIDE COATED BLADE TIPS (SB PW4ENG 72−395) AND THE MORE WEAR RESISTANT

ANTI-ROTATION SLOTS, REAR INNER CASE (SB PW4ENG 72-403).

(6) Install the Stages 13 and 14 stator, flat end up, aligning quadrants with the quadrants of previously installed stage. Make sure that the Stage 14 borescope port is positioned at the 2:30 o'clock location. See Figure 1002.

CAUTION: THE HPC REAR INNER CASE WITH THE MORE WEAR RESISTANT ANTI-ROTATION SLOTS (SB PW4ENG 72-403) MUST BE USED WITH THE 13TH AND 14TH STAGE STATOR SET WITH 24 HOUR OXIDATION CYCLE RING SEGMENTS (SB PW4ENG 72-396).

(7) Install the HPC inner rear case, gangnut, scalloped flange up, over the 11th through 14th stage stators. Carefully drift case to seat on the 10th stage flange after aligning holes in case flange with bolt holes in upper platform flange of the 9th and 10th stage stator. Install eight workbolts, threads lubricated with Engine Oil P03-001, equally spaced to secure case to stator. Tighten bolts to draw flanges together. If necessary, tap case to seat against stator flange. Remove workbolts. See Figure 1003.

Subtask 72-35-00-430-079:

(8) Locate offset holes in both the just installed HPC inner rear case lower flange and the front flange of the HPC (outer) rear case. Install three PWA 29855-6 Aligning Pins equally spaced to the Stages 10 and 11 stator flanges. With the offset holes of each case aligned with each other, lower the outer case over the previously installed inner case and stators, stepped flange down, engaging the three aligning pins. See Figure 1004.

(9) Install four bolts, threads lubricated with Engine Oil P03-001, equally spaced around lower flange on inside diameter of outer rear case and draw rear case down against the previously installed inner rear case and the Stages 9 and 10 stator flange. Remove the three aligning pins and install the remaining 60 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

Subtask 72-35-00-430-080:

CAUTION: THE INSTALLATION OF PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD IS OPTIONAL WITH PN 50J685 COMPRESSOR STATOR EXIT ASSEMBLY.

CAUTION: PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD CANNOT BE INSTALLED WITH PN 51J285-01 OR PN 51J385-01 COMPRESSOR STATOR EXIT ASSEMBLY.

CAUTION: USE PN MS9723-05 BOLTS WITH EXIT GUIDE VANE SUPPORT, HEAT SHIELD AND PN 50H953 HPC REAR SUPPORT (PRE SB PW4ENG 72-234).

CAUTION: USE PN MS9696-06 BOLTS WITHOUT THE SUPPORT AND HEAT SHIELD AND WITH PN 50H953 HPC REAR SUPPORT (POST SB PW4ENG 72-234, PRE SB PW4ENG 72-298).

CAUTION: USE PN MS9723-04 BOLTS WITHOUT THE EXIT GUIDE VANE SUPPORT, HEAT SHIELD AND WITH PN 51H530 REAR SUPPORT (POST SB PW4ENG 72-298).

(10) Install HPC rear support on 14th stage stator flange and on outer rear case, aligning holes in support with holes in inner rear case. Tap to seat. See Figure 1004.

(11) Secure rear support to inner rear case with 62 bolts, threads lubricated with Engine Oil P03-001. Tighten and torque bolts to 36 - 40 lb-in. (4.067 - 4.519 N.m).

Subtask 72-35-00-430-081:

(12) Measure the rubstrip diameters of Stages 8 through 15, using the following tool numbers for the respective stages. Use PWA 86581 Constraint Ring and PWA 86582 Constraint Ring respectively, on the front and rear flanges of the HPC rear case. These constraint rings both improve the roundness of the case and establish reference planes from which to measure the axial location for the diametrical measurements. Refer to Table 1001 for correct axial location of gage points for these diameter measurements. See Figure 1004. Take measurements at sixteen (16) angular locations around the circumference of each rubstrip. Refer to Table 1002 for tooling applied to each stage.

R
R

(13) If Coordinate Measuring Machine (CMM) equipment is available (the preferred method), use PWA 86668 HPC Stator Fixture to clamp the HPC rear stators axially forward in the HPC rear case to more accurately simulate running positions.

D. Postrequisites

(1) Disassemble high pressure compressor (HPC) stators. See 72-35-00, Disassembly-04 Task 72-35-00-030-004.

Stage	Distance From H-Flange Front Face	Chapter/Section	Task Number
8	0.223 inch (5.664 mm)	72-35-59, Inspection/ Check-04	72-35-59-200-004
9	3.124 inch (79.350 mm)	72-35-59, Inspection/ Check-04	72-35-59-200-004
10	5.869 inch (149.073 mm)	72-35-60, Inspection/ Check-04	72-35-60-200-004
11	8.277 inch (210.236 mm)	72-35-60, Inspection/ Check-04	72-35-60-200-004
12	10.627 inch (269.926 mm)	72-35-61, Inspection/ Check-04	72-35-61-200-004
13	13.058 inch (331.673 mm)	72-35-61, Inspection/ Check-04	72-35-61-200-004
14	15.243 inch (387.172 mm)	72-35-62, Inspection/ Check-04	72-35-62-200-004
15	17.398 inch (441.909 mm)	72-35-62, Inspection/ Check-04	72-35-62-200-004

NOTE: H-Flange is the front flange of the HPC (outer) rear case assembly.

(Task 72−35−00−400−005)

Task 72-35-00-430-006:

1. Assemble Stator (Vane) Segment Assemblies

A. Prerequisites

(1) See 72-35-00, Inspection/Check-04 (Task 72-35-00-990-001) for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Special Tools:

PWA 105507	Adapter, Install/Remove, 8th Stage Stator (Vane) Segments
PWA 105508	Adapter, Install/Remove, 10th Stage Stator (Vane) Segments
PWA 105509	Adapter, Install/Remove, 11th Stage Stator (Vane) Segments
PWA 105510	Adapter, Install/Remove, 12th Stage Stator (Vane) Segments
PWA 105511	Adapter, Install/Remove, 13th Stage Stator (Vane) Segments
PWA 105512	Adapter, Install/Remove, 14th Stage Stator (Vane) Segments

Consumable Materials:

Item No.	Designation
P09-014	Rubber, Silicone (PWA 36003)
P11-014	Alcohol, Isopropyl

Expendable Parts:

C. Assemble Stator (Vane) Segment Sets

Subtask 72-35-00-430-111:

(1) See Table 1001 for the applicable stator (vane) segment adapter.

Stage	Stator (Vane) Segment Adapter
8	PWA 105507
10	PWA 105508
11	PWA 105509
12	PWA 105510
13	PWA 105511
14	PWA 105512

Stator (Vane) Segment Assembly Adapters
Table 1001

(2) For each stage, assemble a set of stator (vane) segments as shown in the applicable figure.

(a) For 8th Stage vane assembly set, refer to Figure 1003.

(b) For 10th Stage vane assembly set, refer to Figure 1004.

(c) For 11th Stage vane assembly set, refer to Figure 1005.

(d) For 12th Stage vane assembly set, refer to Figure 1006.

(e) For 13th Stage vane assembly set, refer to Figure 1007.

(f) For 14th Stage vane assembly set, refer to Figure 1008.

(3) In the steps that follow, use the applicable stator (vane) segment set Adapter to obtain the part number sequence to assemble the stator (vane) segment assemblies required for each stage.

(4) Move the moveable arm to the right side of the Adapter.

(5) Assemble the installation arm detail to the moveable arm of the Adapter.

(6) Remove the stop detail from the Adapter base.

(7) Obtain the stator (vane) segments, air seals, and damper (spring) necessary for a stator assembly. See the applicable Figure.

(a) For vane segment assemblies that have three stator (vane) segments, you must assembly the middle segment first.

(b) Assemble the damper to the shroud, engaging the anti−rotation lug in the shroud with the mating slot in the damper.

(c) Put the end of the shroud and damper into the air seal hand holder of the Adapter.

(d) Align the end of the air seal with the slot in the stator (vane) segment and start to engage the parts by hand.

(e) With the anti−rotation lug of the air seal facing up, install the stator (vane) segment, air seal, and damper assembly onto the Adapter. Put the stator (vane) segment in the groove of the Adapter base and the stator (vane) segment end against the tool stop.

(f) In a clockwise direction, use the installation arm to press the air seal and damper into the stator (vane) segment.

(g) Remove the stator (vane) segment, air seal, and damper assembly from the Adapter.

(h) Start the next stator (vane) segment onto the air seal and damper by hand. For vane segment assemblies with three stator (vane) segments, you must assemble the stator (vane) segment that is closest to the Adapter stop detail.

(i) Re−install the stator (vane) segment, air seal, and damper assembly on the Adapter.

(j) In a clockwise direction, use the installation arm to press the air seal and damper into the stator (vane) segment.

(k) Make sure that the inner shrouds touch.

NOTE: Vane segments with too much gap between the stator (vane) segments can prevent the proper assembly of the mating compressor case anti−rotation lugs at final assembly.

(l) For vane segment assemblies that have three stator (vane) segments, proceed as follows:

1 Remove the stator (vane) segment air seal, and damper assembly from the Adapter.

2 Start the stator (vane) segment that is closest to the moveable arm detail by hand.

3 Re−install the stator (vane) segment air seal and damper assembly on the Adapter.

4 In a clockwise direction, use the installation arm to press the air seal and damper into the stator (vane) segment.

5 Make sure that the inner shrouds touch.

NOTE: The stator (vane) segments with too much gap between the segments can prevent the proper assembly of the mating compressor case at final assembly.

(m) Remove the stator (vane) segment from the Adapter.

(8) Repeat the above steps to assemble each of the stator (vane) segment assembly.

(9) Install the thermal insulation blanket to the vane foot as specified in Figure 1002.

(a) Use the PWA 83−C4 (Task 70−48−00−360−001) method to clean the vane foot area, where you will apply silicone rubber, as shown in the applicable figure.

NOTE: You can use Isopropyl Alcohol P11−014 as an alternative solvent.

(b) In an environment with a relative humidity of 20 percent minimum, apply a bead of Silicone Rubber P09−014 to the area shown in the referenced figure.

(c) Cut the thermal blanket to fit the recessed vane foot area and install it as shown in the referenced area as follows.

1 The thermal blanket must not extend into the anti−rotation slot or beyond the ends of the stator assembly.

2 The uncovered areas adjacent to the anti−rotation slot ends and the ends of the stator assembly must not be more than 0.125 inch (3.175 mm) maximum, reference.

(d) Repeat the above steps for each of the stator (vane) segment assemblies.

(e) Cure the sealant for 2 hours before you handle the stator (vane) segments.

HIGH PRESSURE COMPRESSOR (HPC) − ASSEMBLY−20

Task 72−35−00−430−020:

1. Install The Flange J Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install Flange J hardware as follows. See Figure 1001.

(a) Attach the brackets with bolts, threads lubricated with Engine Oil P03−001, and nuts.

(b) Torque the nuts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

HIGH PRESSURE COMPRESSOR (HPC) - ASSEMBLY-21

Task 72-35-00-430-021:

1. Install The Flange H Brackets And Hardware

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

B. Procedure

(1) Install Flange H hardware as follows. See Figure 1001 or Figure 1002.

(a) Attach the brackets with bolts, threads lubricated with Engine Oil P03-001, and nuts.

R (b) For compressors without the ring case configuration (Pre SB PW4ENG 72-756 and 72-759), tighten and torque the nuts to 180 - 200 lb-in. (20.337 - 22.597 N.m).

R (c) For compressors with the ring case configuration (Post SB PW4ENG 72-756 and 72-759), tighten and torque the nuts to 190 - 210 lb-in. (21.467 - 23.727 N.m).

(2) Remove any tags or markings on the brackets or flange.

(3) Examine the assembly for foreign objects, damage, and correct assembly.

HIGH PRESSURE COMPRESSOR (HPC) - STORAGE-01

Task 72-35-00-530-001:

1. Pack High Pressure Compressor (HPC)

A. Container Assembly P60042 (Phase-1)

NOTE: The following table lists assembly number, dimensions, and gross weight for high pressure compressor shipping container available from Pratt & Whitney. Further information can be obtained from:

Commercial Parts Support
Commercial Engine Business
Pratt & Whitney
400 Main St.
East Hartford, CT 06108-0969

Container Assembly No.	Dimensions	Approximate Gross Weight Including High Pressure Compressor
P60042	78 Inch (1981.200 mm) x 72 Inch (1828.800 mm) x 51 Inch (1295.400 mm)	3,726 lbs. (1690.09 kg)

(1) For operators that use P60042 Container for compressors with HPC drive turbine shafts (Pre SB PWENG 72-562), remove the top half of the Container as follows:

(a) Actuate relief valve on side of container to release pressure before opening container.

(b) Loosen nuts on T-head bolts to allow head to be rotated 90 degrees and pass through the slots in the cover flange. See Figure 1201.

NOTE: Do not remove lockwashers and nuts from bolts.

(c) Connect suitable sling to lift cover of container. Using hoist, remove top cover of container and place on the floor.

(2) Verify that the following details are furnished with the container and are present:

HIGH PRESSURE COMPRESSOR (HPC) - STORAGE-01

Quantity	Container Assy No.	Detail No.	Name
Details Of Container Assembly			
1	60042	Detail-1	Support - Front
1	60042	Detail-2	Support - Rear
1	60042	Detail-4	Nut - Front
1	60042	Detail-5	Nut - Rear
1	60042	Detail-7	Locator - Rear
20	60042	Detail-8	Hex Head Cap Screw (.312-18 X 1.0 Inch)
19	60042	Detail-10	Lockwasher (.375 Dia.)
19	60042	Detail-12	Hex Nut (.375-16)
20	60042	Detail-17	Flat Washer (.312 Dia. X .625 Max OD)
1	P60104	Detail-18	Cover
1	P60129-9	Detail-21	Cover
2	P60129-10	Detail-22	Cover
2	P60129-11	Detail-23	Cover
20	60042	Detail-26	Lockwasher (.312 Dia.)
1	P60129-13	Detail-29	Cover
19	60042	Detail-30	Socket Head Cap Screw (.375-16 X 2.0 Inch)
38	60042	Detail-31	Flat Washer (.375 Dia.)
47	60042	Detail-32	Hex Head Bolt (.250-28 X .500 Inch)
1	P60129-9	Detail-33	Cover (Altered As Shown)

B. Container Assemblies P60093, P60271, PWA 105525, And PWA 105526 (Phase-3)

Container Assembly No.	Dimensions	Approximate Gross Weight Including High Pressure Compressor
P60093, P60271, PWA 105525, And PWA 105526	88.5 Inch (2247.900 mm) x 76.5 Inch (1943.100 mm) x 55.5 Inch (1409.700 mm)	3,810 lbs. (1,728.19 kg.)

(1) Remove the top half of the P60093, P60271, PWA 105525, or PWA 105526 Container Assembly as follows: See Table 1201.

HIGH PRESSURE COMPRESSOR (HPC) - STORAGE-01

Container Assembly	Compressor Configuration
P60093	Non-Asymmetric Case Compressors, Without Ring Style Case
P60271	Symmetric And Asymmetric Case Compressors, Without Ring Style Case
PWA 105525 and PWA 105526	All Configurations

Container Assembly Applicability
Table 1201

(a) Actuate relief valve on side of container to release pressure before opening container.

(b) Loosen nuts on T-head bolts to allow head to be rotated 90 degrees and pass through the slots in the cover flange. See Figure 1201.

NOTE: Do not remove lockwashers and nuts from bolts.

(c) Connect suitable sling to lift cover of container. Using hoist, remove top cover of container and place on the floor.

(d) Verify that the following details are furnished with the container and are present:

Quantity	Container Assy No.	Detail No.	Name
Details Of Optional Container Assembly P60271, PWA 105525, And PWA 105526			
1	60093	Detail-1	Support - Front
1	60093	Detail-2	Support - Rear
1	60093	Detail-4	Nut - Front
1	60093	Detail-5	Nut - Rear (For HPC Rear Shaft Pre SB PW4ENG 72-562) (Phase-1)
1	60093	Detail-7	Locator - Rear
20	60093	Detail-8	Hex Head Cap Screw (.312-18 X 1.0 Inch)
1	60093	Detail-9	Nut - Rear (For HPC Rear Shaft Pre SB PW4ENG 72-562) (Phase-1)

HIGH PRESSURE COMPRESSOR (HPC) - STORAGE-01

Quantity	Container Assy No.	Detail No.	Name
Details Of Optional Container Assembly P60271, PWA 105525, And PWA 105526			
(CONTINUED)			
19	60093	Detail-10	Lockwasher (.375 Dia.)
19	60093	Detail-11	Hex Head Cap Screw (.375-16 X 2.0 Inch)
19	60093	Detail-12	Hex Nut (.375-16)
20	60093	Detail-17	Flat Washer (.312 Dia. X .625 Max OD)
1	P60104	Detail-18	Cover
47	60093	Detail-19	Hex Head Bolt (.250-28 X .500 Inch)
1	P60129-9	Detail-21	Cover
2	P60129-10	Detail-22	Cover
2	P60129-11	Detail-23	Cover
1	P60129-9	Detail-24	Cover (Altered As Shown)
20	60093	Detail-26	Lockwasher (.312 Dia.)
1	P60129-13	Detail-28	Cover
19	60093	Detail-29	Flat Washer (.375 Dia.)

C. Equipment And Materials Necessary

Special Tools:

PWA 76154	Adapter, Lift and Turn (4 Necessary)
PWA 85520	Fixture
PWA 85530	Wrench
PWA 85531	Adapter
PWA 85535	Nut, Retaining
PWA 85536	Adapter
PWA 85660	Stand, Lifting
PWA 88643	Sling, Lifting
PWA 88673	Sling, Lifting

Consumable Materials:

Item No. Designation

NOTE: The following items are not normally supplied by the container manufacturer.

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P04-001	Grease
P05-005	Cloth, Lint Free

Consumable Materials:

Item No. Designation

NOTE: The following items are not normally supplied by the container manufacturer.

(CONTINUED)

Item No.	Designation
P05-156	Seal, Lead
P05-262	Lockwire
P11-014	Alcohol, Isopropyl
P15-001	Dehydrator

D. Procedure

NOTE: The high pressure compressor is front end up with PWA
R 85528 Adapter and PWA 85537 Fixture on the front, PWA
R 107219 Fixture on the rear, and in PWA 87022 Support
Stand (Optional PWA 85108 Stand or PWA 85580 Stand).

(1) Remove the PWA 85537 Fixture from the high pressure compressor.

(a) Using PWA 85530 Wrench and PWA 85531 Adapter remove nut which keeps adapter and fixture to HPC front.

(b) Install PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to the spools of the fixture and remove the fixture from the HPC.

(2) Attach two nylon straps around two spokes of detail-1 front support inside shipping container and attach straps to hoist.

(3) Remove front support from container and position it journal side up on table or bench.

(4) Clean ID of journal with Cloth P05-005 and Alcohol P11-014.

(5) Lightly coat OD of hub shaft of rotor and stator with Grease P04-001.

(6) Position front support, journal side up, over front hub of rear compressor in build stand.

(7) Lower support to seat on bearing shoulder of hub and front flange of variable vane case. Align center of lifting spools with splits on variable vane cases and align bolt holes.

(8) Remove hoist and straps from spokes of support. Secure support to case with detail−30 bolts, threads lubricated with Engine Oil P03−001, heads down, with detail−31 washers, detail−10 lockwashers, and detail−12 nuts. Place bolts with washers (heads down) and secure with washers, lockwashers, and nuts. Three or four bolts will be installed, heads up, at the runner location.

(9) Tighten and torque nuts to 270 − 300 lb−in. (30.506 − 33.895 N.m).

CAUTION: IT MAY BE NECESSARY TO ADJUST HEIGHT OF ROTOR TO ALLOW SEATING OF FLANGES OR HUB SHOULDER. EXTREME CARE MUST BE TAKEN WHEN MAKING ADJUSTMENT TO PREVENT INTERNAL DAMAGE.

(10) Secure front support to hub with detail−4 nut lubricated with Engine Oil P03−001 and tighten handtight. Secure nut to front support with Lockwire P05−262.

(11) With PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters attached to the spools of the front support, lift the HPC assembly from the build stand. Attach a second PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters to the spools on the lower fixture. Turn the assembly front end down.

(12) Remove hoist, adapters, and sling from front support and lower assembly onto stand.

(13) Loosen and remove all bolts securing rear fixture to rear case assembly. Remove rear fixture and place in storage area. Remove hoist, sling, and adapters.

(14) Lightly coat OD of hub shaft of rotor and stator with Grease P04−001.

(15) Attach two nylon straps around two spokes of detail−2 rear support inside shipping container and attach straps to hoist.

(16) Remove rear support from container and position it journal side up on table or bench.

(17) Clean ID of journal with Cloth P05-005 and Alcohol P11-014.

(18) Position rear support, journal side up, over rear hub of rear compressor in build stand.

(19) Lower support to seat on bearing shoulder of hub and rear flange of rear case. Align center of lifting spools with spools on front support and align bolt holes.

(20) Remove hoist and straps from spokes of support. Secure support to case with detail-8 bolts, threads lubricated with Engine Oil P03-001, with detail-17 washers, and detail-26 lockwashers.

(21) Tighten and torque bolts to 160 - 175 lb-in. (18.078 - 19.772 N.m).

(22) Install detail-7 locator to OD threads of rear support and thread it on until approximately halfway between shoulder and end of shaft portion of rear support.

NOTE: When assembly is positioned in container it may be necessary to adjust locator to align it with rear clamp.

(23) Secure rear support to hub with detail-5 or -9 nut lubricated with Engine Oil P03-001 and tighten handtight. Secure nut to front support with Lockwire P05-262.

NOTE: For PWA 105525 and PWA 105526 Containers, you can use the detail-31 Wrench to hand tighten the nut.

(24) Install shipping covers and secure with bolts, threads lubricated with Engine Oil P03-001. See Figure 1202. Tighten bolts to 75 lb-in. (8.474 N.m) maximum.

(25) With PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters attached to the spools of the rear support, raise the HPC assembly from the build stand. Attach a second PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to the spools on the lower fixture. Turn the assembly to a horizontal position.

(26) Carefully lower assembly into container, positioning front and rear support into clamps. Front end of assembly must be positioned in clamp marked front.

NOTE: As necessary, adjust position of locator on rear support to fit in rear clamp.

(27) Secure assembly with clamps and swing bolts, lockwashers, and nuts. Tighten and torque two nuts, lubricated with Engine Oil P03−001 on swing bolts 1250 − 1400 lb−in. (141.231 − 158.179 N.m).

(28) Remove slings from front and rear supports and remove hoists.

(29) Attach nylon straps to lifting rings on each end of cover and to hoist. Raise cover and position over container.

(30) Carefully lower the container cover over assembly (aligning alignment holes and pins) to seat on container flange.

(31) Secure cover with T−head bolts pushed up and rotated 90 degrees to engage bolt head in notch on cover.

(32) Remove hoist and nylon straps.

(33) Tighten and torque container flange nuts as specified on container cover. Seal container with Seal P05−156 and Lockwire P05−262.

(34) Loosen and remove cover from desiccant receptacle. Place quantity of Dehydrator P15−001 inside receptacle as specified on container cover and reinstall receptacle cover. Tighten to secure cover.

Task 72−35−00−540−001:

2. Unpack High Pressure Compressor Group

A. Equipment And Materials Necessary

Special Tools:

	PWA 76154	Adapter, Lift And Turn (4 Necessary)
	PWA 85108	Stand, Build (Optional to PWA 85580 or PWA 87022)
	PWA 85530	Wrench
R	PWA 85535	Nut, Retaining
	PWA 85536	Adapter, Torque
	PWA 85580	Stand, Build (Optional to PWA 85108 or PWA 87022)
R	PWA 88643	Sling, Lifting (Optional to PWA 88763)
	PWA 88673	Sling
	PWA 87022	Stand, Build
	PWA 88701	Nut, Retaining
	PWA 88763	Sling, Lifting (Optional to PWA 88643)
R R	PWA 107219	Fixture, Handling (For Non−Ring Style Compressor Case)

B. Procedure

(1) Cut and remove lockwire and seal from container flange.

(2) Remove top half of the Container Assembly as follows:

(a) Actuate relief valve on side of container to release any pressure inside container.

(b) Loosen nuts on T−head bolts to allow head to be rotated 90 degrees and pass through the slots in the cover flange.

NOTE: Do not remove lockwashers and nuts from bolts.

(c) Connect suitable sling to lift cover of container. Using hoist, remove top cover of container and place on the floor.

(3) Install PWA 88643 or PWA 88673 Sling and four PWA 76154 Adapters to the spools of the front and rear supports.

(4) Loosen nuts from swing bolts to disengage clamps. Do not remove nuts and lockwashers.

(5) Carefully remove HPC assembly from container.

HIGH PRESSURE COMPRESSOR (HPC) − STORAGE−01

(6) With the HPC assembly in horizontal position lower to front end down onto PWA 87022 Build Stand (Optional PWA 85108 Stand or PWA 85580Stand). Remove the slings and hoists.

(7) Cut lockwire and remove knurled nut from rear support. Remove locator from OD threads of rear support.

(8) Remove bolts securing rear support to case.

(9) Attach two nylon straps around two spokes of rear support and attach straps to hoist. Remove rear support.

R (10) Install the PWA 107219 Fixture over the rear shaft and to the HPC case with a PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters. Remove the Sling and Adapters.

(11) FOR THESE MODELS: 4152, 4156A, 4158
R Secure Fixture to HPC rear case with cap screws. Install PWA 85535 Nut over rear hub and tighten with PWA 85530 Wrench using PWA 85536 Adapter to 300 lb−in. (33.895 N.m).

(12) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R (Pre SB PW4ENG 72−562) Attach the PWA 107219 Fixture to the HPC rear case with cap screws. Install the PWA 85535 Nut over the HPC rear shaft and tighten with the PWA 85530 Wrench using the PWA 85536 Adapter to 300 lb−in. (33.895 N.m).

(13) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R (Post SB PW4ENG 72−562) Attach the PWA 107219 Fixture to the HPC rear case with cap screws. Install the PWA 88701 Nut over the HPC rear shaft and tighten with the PWA 85530 Wrench using the PWA 85536 Adapter to 300 lb−in. (33.895 N.m).

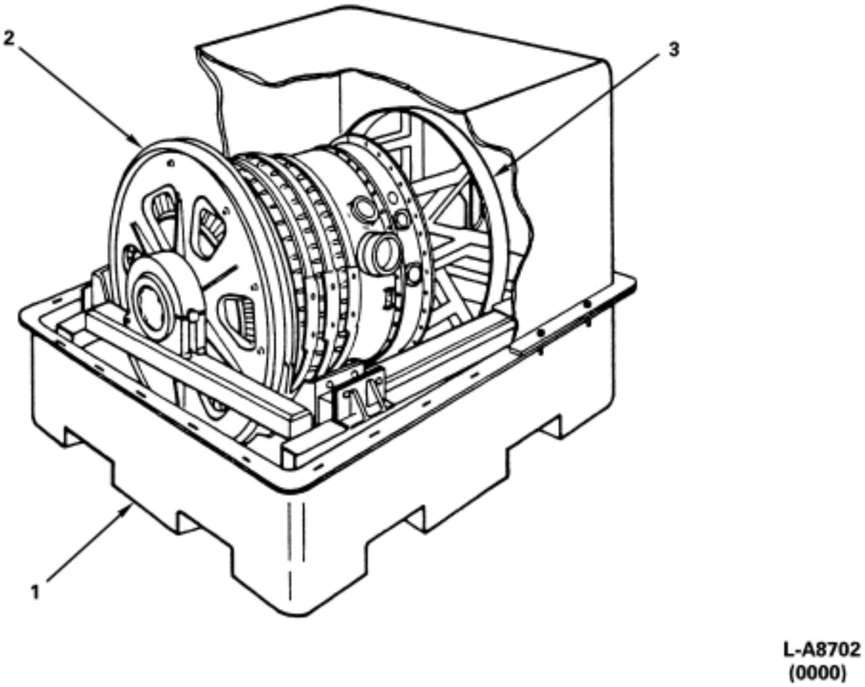
R (14) Attach PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters to the spools on the rear fixture and lift the rotor from the stand. Attach a second PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters to the spools on the lower fixture. Turn the assembly rear end down.

R (15) Remove hoist, adapters, and sling from rear support and lower assembly rear end down onto stand.

R (16) Cut lockwire and remove knurled nut from front support. Remove nuts, lockwashers, and bolts securing support to front case.

R (17) Attach two nylon straps around two spokes of front support and attach straps to hoist. Remove front support.

R (18) Remove bolts securing covers on rear case and remove all covers.



1. Shipping Container (Typical)
2. Detail−1 Front Support
3. Detail−2 Rear Support

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - High Pressure Compressor (HPC)

List of Effective Pages - High Pressure Compressor (HPC)

See end of list.

Task 72-35-01-040-001:

1. Disassemble (Bladed) Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

	PWA 29389	Pump
	PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
	PWA 85086	Lift Arm
	PWA 85125	Support, Drum Rotor
R R	PWA 85127	Adapter, Lift And Trunnion (Replaced By PWA 107349)
	PWA 85133	Adapter, Lift And Trunnion
	PWA 85161	Adapter, Lift
	PWA 85163	Adapter, Lift And Trunnion
R R	PWA 85166	Puller, Jackscrew (5th Stage Disk) (Replaced By PWA 107285)
	PWA 85296	Puller
	PWA 85297	Puller, Front Drum (For Application, See Text)
	PWA 85304	Wrench, System Torque (Optional to PWA 86215)
	PWA 85328	Stand, Storage (2 Necessary)
	PWA 86060	Console, Data Acquire
	PWA 86061	Test Stand, Calibration
	PWA 86215	Wrench System, Torque
	.PWA 86062	Assembly, Gearbox
	.PWA 86063	Module, Software
	.PWA 86064	Assembly, Gearbox
	.PWA 86065	Module, Software
	.PWA 86066	Adapter, Calibration
	.PWA 86067	Module, Software
	.PWA 86068	Cabinet, Storage
	.PWA 101501	Locator, Bolt
	PWA 86473	Wrench (Optional to PWA 85304 and PWA 86215)
	PWA 86474	Wrench (Optional to PWA 85304 and PWA 86215)
	PWA 86476	Wrench (Optional to PWA 85304 and PWA 86215)
	PWA 88643	Sling (Optional to PWA 88673)
	PWA 88673	Sling
	PWA 88770	Puller, Front Drum
	PWA 101480	Wrench (Optional to PWA 85304 and PWA 86215)
	PWA 102711	Holder, Tierod (If necessary)
R	PWA 107285	Puller, Jackscrew (5th Stage Disk)
R	PWA 107349	Adapter, Lift And Trunnion

AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−01

Special Tools:

(CONTINUED)

NOTE: The PWA 86215 Wrench System has all the tools indicated below the system.

B. Procedure

NOTE: Axial compressor rotor assembly is in PWA 80515 Support Stand with PWA 85294 Adapter, rear end down, with external cases removed. PWA 85160 Thread Protector is installed on front hub and PWA 85159 Thread Protector is installed on rear shaft.

(1) (Pre SB PW4ENG 72−515) Drift rivets from counterweights. Remove counterweights from airseal flange.

(2) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 System Torque Wrench with the PWA 86060 Data Acquisition Console) and the PWA 86061 Calibration Test Stand to loosen the 42 tierod nuts that hold the 5th stage disk and front hub to the front drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system). Remove 42 nuts that secure the 5th stage and front hub to drum.

NOTE: As an option to the above wrenches, PWA 86474 Wrench can be used to loosen the 42 nuts and PWA 86476 Wrench can be used to remove the 42 nuts.

(a) If necessary, use PWA 102711 Holder to prevent the tierod from turning when you remove the nut.

R (3) Use PWA 85166 or PWA 107285 Puller to remove the stage 5 disk and blades assembly from the drum snap. Remove the puller.

(4) Install PWA 85163 Adapter to disk blades. Using hoist and PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters, remove disk and blades from rotor and install on PWA 85328 Storage Stand tierods down. Remove hoist, sling adapters and adapter.

(5) Install PWA 85296 Puller to front hub and front drum rotor. Using PWA 29389 Pump remove hub from snap fit. Remove pump and puller.

(6) Install PWA 85161 Adapter to front hub threads. Using hoist and PWA 85086 Arm attached to hub, remove hub from rotor. Remove hoist, arm and adapter from hub.

(7) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 System Torque Wrench with the PWA 86060 Data Acquisition Console) and the PWA 86061 Calibration Test Stand to loosen the 42 tierod nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system). Remove 42 nuts that secure the front drum rotor to the rear drum rotor.

NOTE: As an option to the above wrenches, PWA 86473 Wrench can be used to loosen the 42 nuts and PWA 101480 Wrench can be used to remove the 42 nuts.

(8) Use a hoist and PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to install PWA 85133 Adapter to front drum flange. Remove the hoist, sling, and adapters.

(9) FOR THESE MODELS: 4152, 4156A, 4158
Using PWA 85297 Puller with PWA 29389 Pump attached to adapter remove front drum from rear drum snap. Remove puller.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
It is not necessary to remove the 9th stage bleed air tubes from the front drum assembly.

(10) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Use PWA 88770 Puller with PWA 29389 Pump attached to adapter to remove the front drum from the rear drum snap. Remove the puller.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
It is not necessary to remove the 9th stage bleed air tubes from the front drum assembly.

(11) Install hoist and PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to PWA 85133 Adapter on the front drum to remove front drum rotor and install it onto the PWA 85328 Storage Stand. Remove the hoist, sling, and adapters.

(12) Put the drum rotor and blades (rear) assembly in the PWA 85125 Support. See Figure 501.

R (a) Install PWA 85127 or PWA 107349 Adapter to the
R tierod end of the drum rotor. See Figure 501.

(b) Use PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to lift the drum rotor from the Stand.

R (c) Lower the drum rotor into the PWA 85125 Stand.
R See Figure 502.

(d) Remove the hoist, Sling, and Adapters.

C. Postrequisites

(1) Disassemble The Drum Rotor And Blades (Rear) Assembly. Refer to 72-35-39, Disassembly-01 CONFIG-1 (Task 72-35-39-040-001), or CONFIG-2 (Task 72-35-39-040-002-001), or (Task 72-35-39-040-002-002).

AXIAL COMPRESSOR ROTOR ASSEMBLY - DISASSEMBLY-20

Task 72-35-01-040-003:

1. Disassemble (Deblade) The Axial Compressor Rotor Assembly

NOTE: The axial compressor rotor assembly is in a build stand made of a PWA 80515 Support Stand, PWA 85294 Support Adapter, PWA 85593 Adapter Ring and a PWA 85580 Support Stand. A PWA 85160 Thread Protector is installed on the front hub and a PWA 85159 Thread Protector is installed on the rear shaft. A PWA 87383 Protector is installed over the bladed drum assembly. See Figure 501.

A. Equipment And Materials Necessary

Special Tools:

PWA 83135	Driver
PWA 83136	Extension
PWA 86447	Blade Positioning Drift
PWA 86448	Blade Positioning Drift
PWA 86652	Blade Positioning Drift (Optional to PWA 86447)
PWA 87075	Removal Kit
PWA 87754	Tab Bending Drift

B. Procedure

(1) (Pre and Post SB PW4ENG 72-373) Use PWA 87754 Drift and a mallet to unbend the tab of the locks and remove the locks from the 5th disk. Discard the blade locks. See Figure 502.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE, REQUIRED TO DEBLADE DISK, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(2) If necessary, use drift and mallet at blade root area to remove blade from disk.

(3) Remove all blades and place them in blade tray.

(4) (Pre SB PW4ENG 72-373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 6th stage blade root at two locations. Do this procedure again at 10 locks. Drift all the locks in the same direction to place the cutouts in the lock under the blade roots to permit blade removal. See Figure 502.

(5) (Post SB PW4ENG 72−373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 6th stage blade root. Remove the blade lock. Do this procedure again for 51 locks. Discard the locks.

CAUTION: YOU MUST MAKE SURE THAT WHEN YOU APPLY ANY PRESSURE OR FORCE, NECESSARY DURING REMOVAL OF BLADES, YOU APPLY THAT PRESSURE OR FORCE TO THE ROOT PLATFORM AREA OF THE BLADE AND NOT TO THE LEADING OR TRAILING EDGE OF THE AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE. USE THE PWA 86447 OR PWA 86652 DRIFT TO HELP REMOVE THE BLADES. USE MINIMUM FORCE ON THE TOOL.

CAUTION: DO NOT TRY TO MOVE ALL THE BLADES AT ONE TIME WITH THE PWA 86448 DRIFT, MOVE ONLY APPROXIMATELY FIVE BLADES AT A TIME OR DAMAGE TO THE DRIFT CAN RESULT.

(6) (Pre SB PW4ENG 72−373) Push down on the blade platforms to remove the blades from the drum and remove the lock. Do this procedure against 10 places. Discard the locks.

(7) (Pre SB PW4ENG 72−373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 7th stage blade root at two locations. Do this procedure again at 11 locks. Drift all the locks in same direction to place the cutouts in the lock under the blade roots to permit blade removal.

(8) (Post SB PW4ENG 72−373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 7th stage blade root. Remove the blade lock. Do this procedure again for 56 locks. Discard the locks.

CAUTION: YOU MUST MAKE SURE THAT WHEN YOU APPLY ANY PRESSURE OR FORCE, NECESSARY DURING REMOVAL OF BLADES, YOU APPLY THAT PRESSURE OR FORCE TO THE ROOT PLATFORM AREA OF THE BLADE AND NOT TO THE LEADING OR TRAILING EDGE OF THE AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE. USE THE PWA 86447 OR PWA 86652 DRIFT TO HELP REMOVE THE BLADES. USE MINIMUM FORCE ON THE TOOL.

CAUTION: DO NOT TRY TO MOVE ALL THE BLADES AT ONE TIME WITH THE PWA 86448 DRIFT, MOVE ONLY

APPROXIMATELY FIVE BLADES AT A TIME OR DAMAGE TO THE DRIFT CAN RESULT.

(9) (Pre SB PW4ENG 72−373) Push down on the blade platforms to remove the blades from the drum and remove the lock. Do this procedure against 11 places. Discard the locks.

(10) (Pre SB PW4ENG 72−373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 8th stage blade root at two locations. Do this procedure again at nine locks. Drift all the locks in same direction to place the cutouts in the lock under the blade roots to permit blade removal.

(11) (Post SB PW4ENG 72−373) Use PWA 87754 Drift with a plastic hammer to unbend the tab on the lock at the 8th stage blade root. Remove the blade lock. Do this procedure again for 53 locks. Discard the locks.

CAUTION: YOU MUST MAKE SURE THAT WHEN YOU APPLY ANY PRESSURE OR FORCE, NECESSARY DURING REMOVAL OF BLADES, YOU APPLY THAT PRESSURE OR FORCE TO THE ROOT PLATFORM AREA OF THE BLADE AND NOT TO THE LEADING OR TRAILING EDGE OF THE AIRFOIL. AIRFOIL SECTIONS OF ALL BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE. USE THE PWA 86447 DRIFT OR PWA 86652 DRIFT TO HELP REMOVE THE BLADES. USE MINIMUM FORCE ON THE TOOL.

CAUTION: DO NOT TRY TO MOVE ALL THE BLADES AT ONE TIME WITH THE PWA 86448 DRIFT, MOVE ONLY APPROXIMATELY 5 BLADES AT A TIME OR DAMAGE TO THE DRIFT CAN RESULT.

(12) (Pre SB PW4ENG 72−373) Push down on the blade platforms to remove the blades from the drum and remove the lock. Do this procedure against nine places. Discard the locks.

(13) FOR THESE MODELS: 4152, 4156A, 4158
Turn the drum to find two blade locks at the 9th stage and loosen the locks. For engines with SB PW4ENG 72−254, use the PWA 83135 Driver and PWA 83136 Extension. For engines without SB PW4ENG 72−254, use a standard hex head driver.

(14) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Turn the drum to find two blade locks at the 9th stage and loosen the locks. Use the PWA 83135 Driver and PWA 83136 Extension.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When you find a lock setscrew that will not move use PWA 87075 Removal Kit. The kit has drills to remove the setscrews.

(15) If it is necessary to remove a setscrew with the PWA 87075 Removal Kit, set the depth of the drill with the set block detail to the correct depth as follows:

(a) For the HPC 9th stage setscrew(s), set the drill depth to 0.304 − 0.314 inch (7.72 − 7.98 mm).

(b) For the HPC 10th stage setscrew(s), set the drill depth to 0.244 − 0.254 inch (6.20 − 6.45 mm).

(c) For the HPC 11th stage setscrew(s), set the drill depth to 0.234 − 0.244 inch (5.94 − 6.20 mm).

(d) For the HPC 12th stage setscrew(s), set the drill depth to 0.237 − 0.247 inch (6.02 − 6.27 mm).

CAUTION: THE DRILLS THAT ARE SUPPLIED WITH PWA 87075 BLADE LOCK REMOVAL KIT HAVE LEFT HAND FLUTES. YOU MUST ROTATE THESE DRILLS IN A COUNTERCLOCKWISE (CCW) DIRECTION OR DAMAGE TO THE DRILLS CAN OCCUR.

(16) After you have correctly set the depth of the drill, drill out the setscrew of the blade lock. Remove the setscrew with a standard drift.

(17) FOR THESE MODELS: 4152, 4156A, 4158
Turn the drum 180 degrees and loosen the locks at the opposite side of the 9th stage. For engines with SB PW4ENG 72−254, use the PWA 83135 Driver and PWA 83136 Extension. For engines without SB PW4ENG 72−254, use a standard hex head driver.

(18) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Turn the drum 180 degrees and loosen the locks at the opposite side of the 9th stage. Use the PWA 83135 Driver and PWA 83136 Extension.

CAUTION: USE THE PWA 86448 DRIFT TO MOVE THE BLADES TO THE LOADING SLOT. THE USE OF A DIFFERENT METHOD CAN CAUSE AIRFOIL DAMAGE. USE MINIMUM FORCE ON THE TOOL.

CAUTION: DO NOT TRY TO MOVE ALL THE BLADES AT ONE TIME WITH THE PWA 86448 DRIFT, MOVE ONLY APPROXIMATELY FIVE BLADES AT A TIME OR DAMAGE TO THE DRIFT CAN RESULT.

(19) Use the PWA 86448 Drift and move the blades, approximately five blades at a time, to the left or right until one blade is between two blade locks. This will position the blade at the loading slot. Remove the blade from drum.

(20) Move the blades to the left or the right of the loading slot to remove all the blades, blade locks and seals from the drum.

(21) Do the Stage 9 procedure to remove the blades from the remaining Stages 10 through 12.

(22) FOR THESE MODELS: 4152, 4156A, 4158
Rotate drum to locate two blade locks at 13th stage and loosen the locks. For engines with SB PW4ENG 72−254 use the PWA 83135 Driver and PWA 83136 Extension. For engines without SB PW4ENG 72−254, use a standard hex head driver.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
When you find a lock setscrew that will not move, use PWA 87075 Removal Kit. The kit has drills to remove the setscrew.

(23) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Rotate drum to locate two blade locks at 13th stage and loosen locks using PWA 83135 Driver and PWA 83136 Extension.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
When you find a lock setscrew that will not move, use PWA 87075 Removal Kit. The kit has drills to remove the setscrew.

(24) If it is necessary to remove a setscrew with the PWA 87075 Removal Kit, set the depth of the drill with the set block detail to the correct depth as follows:

(a) For the HPC stage 13 and 14 blade setscrew(s), set the drill depth to 0.193 − 0.203 inch (4.90 − 5.16 mm).

(b) For the HPC stage 15 blade setscrew(s), set the drill depth to 0.189 − 0.199 inch (4.80 − 5.05 mm).

CAUTION: THE DRILLS THAT ARE SUPPLIED WITH PWA 87075 BLADE LOCK REMOVAL KIT HAVE LEFT HAND FLUTES. YOU MUST ROTATE THESE DRILLS IN A COUNTERCLOCKWISE (CCW) DIRECTION OR DAMAGE TO THE DRILLS CAN OCCUR.

(25) After you have correctly set the depth of the drill, drill out the setscrew of the blade lock. Remove the setscrew with a standard drift.

(26) FOR THESE MODELS: 4152, 4156A, 4158
Rotate drum 180 degrees and loosen the locks at the opposite side of the 13th stage. For engines with SB PW4ENG 72−254, use the PWA 83135 Driver and PWA 83136 Extension. For engines without SB PW4ENG 72−254, use a standard hex head drive.

(27) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Rotate drum 180 degrees and loosen locks using PWA 83135 Driver and PWA 83136 Extension at opposite side of 15th stage.

CAUTION: USE THE PWA 86448 DRIFT TO MOVE THE BLADES TO THE LOADING SLOT. THE USE OF A DIFFERENT METHOD CAN CAUSE AIRFOIL DAMAGE. USE MINIMUM FORCE ON THE TOOL.

CAUTION: DO NOT TRY TO MOVE ALL THE BLADES AT ONE TIME WITH THE PWA 86448 DRIFT, MOVE ONLY APPROXIMATELY FIVE BLADES AT A TIME OR DAMAGE TO THE DRIFT CAN RESULT.

(28) Use the PWA 86448 Drift and move the blades, approximately five blades at a time, to the left or the right until one blade is between two blade locks. This will position the blade at the loading slot.

(29) Remove all blades, blade locks and seals from drum by moving blades to left or right of loading slot.

(30) Do the Stage 13 procedure to remove the blades from the remaining Stages 14 and 15.

.PWA 86065	Module, Software
.PWA 86066	Adapter, Calibration
.PWA 86067	Module, Software
.PWA 86068	Cabinet, Storage
.PWA 101501	Locator, Bolt
PWA 86473	Wrench (Optional To PWA 85304 And PWA 86215)
PWA 86474	Wrench (Optional To PWA 85304 And PWA 86215)
PWA 86476	Wrench (Optional To PWA 85304 And PWA 86215)
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling
PWA 88770	Puller, Front Drum
PWA 101480	Wrench (Optional To PWA 85304 And PWA 86215)
PWA 102107	Pusher, Manual
PWA 102711	Holder, Tierod (If Necessary)

NOTE: The PWA 86215 Wrench System has all the tools indicated below the system.

AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−21

B. Procedure
Figure 501.

NOTE: Axial (debladed) compressor rotor assembly is in PWA 80515 Support Stand with PWA 85294 Adapter, rear end down. PWA 85160 Thread Protector is installed on front hub and PWA 85159 Thread Protector is installed on rear shaft.

(1) (Pre SB PW4ENG 72−515) Drift rivets from counterweights. Remove counterweights from airseal flange.

(2) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 System Torque Wrench with the PWA 86060 Data Acquisition Console) and the PWA 86061 Calibration Test Stand to loosen the 42 tierod nuts that hold the 5th stage disk and front hub to the front drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system). Remove 42 nuts that secure the 5th stage and front hub to drum.

NOTE: As an option to the above wrenches, PWA 86474 Wrench can be used to loosen the 42 nuts and PWA 86476 Wrench can be used to remove the 42 nuts.

(a) If necessary, use PWA 102711 Holder to prevent the tierod from turning when you remove the nut.

(3) Using PWA 85166 Puller, remove stage 5 disk from drum snap. Remove puller.

(4) Install PWA 85162 Adapter to disk blade slots. Using hoist and PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters, remove disk from rotor and install on PWA 85328 Storage Stand tierods down. Remove hoist, sling adapters and adapter.

(5) For engines incorporating integral inlet airseal and 5th stage disk (Post SB PW4ENG 72−290), install PWA 85426 Protector on airseal.

(6) For engines not incorporating integral inlet airseal and 5th stage disk (Pre SB PW4ENG 72−290), remove 40 nuts and bolts securing airseal to Stage 5 HPC disk. Using PWA 85165 Airseal Puller, remove airseal from disk.

AXIAL COMPRESSOR ROTOR ASSEMBLY − DISASSEMBLY−21

(7) Reinstall PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters and hoist to adapter on blade slots. Raise disk and trunnion to tierod up. Lower disk on stand.

(8) Using PWA 102107 Adapters, remove tierods from disk flange.

(9) Raise disk from support and trunnion to flange side down on stand. Remove hoist, sling and adapters from adapter. Remove adapter from disk.

(10) Install PWA 85296 Puller to front hub and front drum rotor. Using PWA 29389 Pump remove hub from snap fit. Remove pump and puller.

(11) Install PWA 85161 Adapter to front hub threads. Using hoist and PWA 85086 Arm attached to hub, remove hub from rotor. Remove hoist, arm and adapter from hub.

(12) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 System Torque Wrench with the PWA 86060 Data Acquisition Console) and the PWA 86061 Calibration Test Stand to loosen the 42 tierod nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system). Remove 42 nuts that secure the front drum rotor to the rear drum rotor.

NOTE: As an option to the above wrenches, PWA 86473 Wrench can be used to loosen the 42 nuts and PWA 101480 Wrench can be used to remove the 42 nuts.

(13) FOR THESE MODELS: 4152, 4156A, 4158
Using PWA 85297 Puller with PWA 29389 Pump remove front drum from rear drum snap. Remove puller.

NOTE: FOR THESE MODELS: 4152, 4156A, 4158
It is not necessary to remove the 9th stage bleed air tubes from the front drum assembly.

(14) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Use PWA 88770 Puller with PWA 29389 Pump to remove the front drum from the rear drum snap. Remove the puller.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
It is not necessary to remove the 9th stage bleed air tubes from the front drum assembly.

(15) Install PWA 85133 Adapter to front drum flange. Use a hoist and PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to remove front drum rotor and install it onto the PWA 85328 Storage Stand. Remove the hoist, sling, and adapters.

C. Postrequisites

(1) Disassemble the drum rotor (rear) assembly.

(a) Disassemble The Drum Rotor And Blades (Rear) Assembly. Refer to 72−35−39, Disassembly−01, CONFIG−1 (Task 72−35−39−040−001), steps 1.C.(1) to 1.C.(9).

(b) Disassemble The Drum Rotor And Blades (Rear) Assembly Rear Shaft Removal − Method 1. Refer to 72−35−39, Disassembly−01, CONFIG−2 (Task 72−35−39−040−002−001) steps 1.C.(1) to 1.C.(8).

(c) Disassemble The Drum Rotor And Blades (Rear) Assembly Rear Shaft Removal − Method 2. Refer to (Task 72−35−39−040−002−002), steps 1.C.(1) to 1.C.(14).

AXIAL COMPRESSOR ROTOR ASSEMBLY - INSPECTION/CHECK-00

Task 72-35-01-990-001:

1. Inspection/Check Part Number Index - Axial Compressor Rotor Assembly - Deleted

   A. Inspection Functional Arrangement

      (1) This task has been deleted.

AXIAL COMPRESSOR ROTOR ASSEMBLY - INSPECTION/CHECK-03

Task 72-35-01-200-003:

1. Visual Inspection - Axial Compressor Rotor Assembly

A. Prerequisites

(1) See Inspection/Check-00 Task 72-35-01-990-001 for functional arrangement and part number applicability.

B. Equipment And Materials Required - None

C. Procedure
See Figure 801 and Figure 802.

Subtask 72-35-01-220-051:

(1) Accomplish inspection requirements whenever extent of engine disassembly permits. It is not necessary to remove any parts for the purpose of inspection unless inspection reveals that additional disassembly is required.

(2) Visually inspect rotor assembly for obvious surface damage and/or deformations which will preclude proper functioning of rotor.

(a) You can use a fluorescent (white) light and a 10X magnifying glass to examine all areas for cracks.

(b) Pay special attention to the spacer areas between the 5th and 6th stages and between the 6th and 7th stages.

(c) If no cracks are found using visual inspection, make a local fluorescent inspection of the spacer areas using SPOP 70.

(d) No cracks are permitted.

(3) HPC rotor assemblies that pass all inspection/check requirements may be returned to service. Assemblies that do not pass inspection requirements must be repaired per its applicable manual section.

Subtask 72-35-01-220-052:

(4) Inspect HPC front hub for:

(a) Indications of cracks, nicks, dents, scratches or corrosion pits.

(b) Security of counterweights.

(c) Damaged threads or splines.

Subtask 72-35-01-220-053:

(5) Inspect blades for:

(a) Indications of blade rub and excessive looseness.

(b) Indications of foreign object damage. If foreign object damage is found, and the rotor assembly is not scheduled for disassembly and the blades are not scheduled for overhaul, you can blend repair the damaged blades by 72-35-01, Repair-01 Task 72-35-01-300-001.

(c) Security of silicone rubber sealant around blade slots (Stages 5 through 8).

(d) Indications of missing blade tip coating due to chipping or disbonding, Stages 9 through 15. See Figure 802. (Post SB PW4ENG 72-484 - Aluminum Oxide Tip Coating, Stages 9 - 15) (Post SB PW4ENG 72-575 - Zirconium Oxide (ZrOx) Tip Coating, Stages 13 - 15)

R
R
R 1 Each blade can have chipped coating to 0.020 inch (0.508 mm) maximum in length at either the leading or trailing edge.

R 2 Chipping at the leading and/or the trailing edges of the blade tip is permitted on 50 percent of the blades in any one stage (both corners) up to a maximum of 0.075 inch (1.905 mm).

R 3 Up to 10 percent of the blades in any one stage may be chipped up to 0.250 inch (6.35 mm) chordwise length down to the base metal at the leading or trailing edge or mid-chord.

R 4 Four blades in any one stage can have chips up to 0.375 inch at the leading and trailing edges for ZrOx tip blades only.

R 5 Two blades in any one stage can have chips up to 1.000 inch long anywhere on the tip for ZrOx tipped blades only.

R 6 Blades which exhibit loss of tip coating due to disbonding are to be treated the same as chipped blades if no visible separation exists between the base metal and the remaining coating.

R 7 Blades with visual separation must be replaced.

Subtask 72−35−01−220−054:

(6) Inspect drum rotors and 5th disk for:

(a) Cracks or bent knife−edge seals.

(b) All accessable surfaces for cracks, dents, nicks, scratches or corrosion pits.

(7) If blades are removed from the 13th, 14th and 15th stages and the rear drum is not undergoing full fluorescent penetrant inspection, locally inspect the blade locking slots and the blade loading slots using 10X magnification and SPOP 70 (Ultra High Sensitivity), refer to the Standard Practices Manual, PN 585005. No cracks are permitted.

(8) If blades are removed from all or any of the 9th thru 15th stages and the HPC rotor is not planned for complete disassembly, nicks, dents, scratches are permitted without repair to the limits specified in Figure 803.

Subtask 72−35−01−220−055:

(9) Inspect all blade locks for broken, missing or loose locks.

(10) Inspect all blade lock set screws to verify that screws are flush or below blade platform surface.

Subtask 72−35−01−220−056:

(11) Inspect rear stages of blades, 9 thru 15, for platform space gap. A gap of 0.075 inch (1.905 mm) is permitted if HPC rotor assembly is not scheduled for disassembly.

AXIAL COMPRESSOR ROTOR ASSEMBLY − REPAIR−01

Task 72−35−01−300−001:

1. Blend Installed HPC Blade Airfoils Stages 5 Through 15

A. Equipment And Materials Required − None

B. General Requirements

(1) This procedure is applicable for a bladed rotor assembly that is not scheduled for disassembly with blades that are not scheduled for overhaul. If the following steps and limitations are followed, glass bead peening is not necessary.

C. Procedure
See Figures 901, 902 and 903.

Subtask 72−35−01−350−051:

(1) Blend airfoil damage by the limits that follow:

NOTE: Compressor blade limits, specified below, are evaluated from the standpoint of performance and structural integrity. The greater the number of stages blended to the maximum limits the more likely it can adversely change compressor efficiency and engine performance.

(a) Blades with crack indications cannot be repaired and must be removed.

(b) Limits are applied to damaged areas after blending and not to the quantity of damage measured before blending.

(c) Nicks in the leading and trailing edges become more critical closer to the blade root. Damage on the inner half of the airfoil must be thought of for repair only after the most careful inspection.

1 Stage 5 leading edge blending in Area E is not permitted on installed blades (See Figure 902). Stage 5 blades with damage in this area must be removed and subsequently inspected and repaired by the information given in 72−35−11, PW4000 Series CIR, PN 51A357.

(d) Blade areas, that have damage (which have blade material compressed and edges raised) and damage with small radii or ragged edges, must be blended.

(e) The total blend length on all rear compressor blade edges must not be more than one−quarter of the total edge length.

(f) Blends on both edges (leading and trailing) must not be directly opposite and must be isolated diagonally by a minimum distance equal to the mean chordal length of the blade. See Figure 901.

(g) The length of a blend must be four times its depth.

(h) Limit the number of blades blended more than 80 percent of the maximum permitted length and depth in each stage to 20 percent.

(i) Only one corner can be blended on each blade. Minor burrs on the leading or trailing edge corners can be blended on all stages and are not considered as full corner blends. Blend limits for Area C apply to resultant edges. See Figure 902 and Figure 903.

(j) Leading and trailing edges must be free of roughness, sharp or blunt edges and curled edges. Smooth edges as necessary with 240 grit or finer emery cloth. Finish with 320 grit emery cloth or crocus cloth. Minimize material removal as the decrease in chord width decreases the stability margin.

(k) All material removal must be done in a radial direction. Do not use a chordwise motion while blending.

(l) One blend to the maximum permitted depth is permitted for each blade. Any number of lesser blends in the specified limits is permitted.

(m) Make a fluorescent penetrant inspection of the repaired blades by 72−35−00, Inspection/Check−02 Task 72−35−00−230−000, PW4000 Series CIR, PN 51A357. Make sure that all indications of damage are removed. No cracks are permitted.

(2) Polish Area D of the airfoil by the limits that follow:

(a) Small imperfections can be polished smooth in Area D.

(b) If the surface imperfections cannot be removed by the polish procedure, the blade must be rejected. Blend repairs are not permitted in Area D. See Figure 902 and Figure 903.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-01

Task 72-35-01-440-001:

1. Assemble (Bladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Complete stage 5 HPC disk and blades assembly. See 72-35-37, Assembly-03 Task 72-35-37-440-003.

(2) Complete drum rotor and blades (front) assembly. See 72-35-38, Assembly-11 Task 72-35-38-440-011.

(3) Complete drum rotor and blades (rear) assembly. See 72-35-39, Assembly-08 Task 72-35-39-440-008.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 12632	Nut
PWA 12633	Ram
PWA 29389	Pump
PWA 29754	Heater Control
PWA 75028	Gage
PWA 76154	Adapter (2 Necessary)
PWA 80513	Rod
PWA 85086	Lift Arm (2 Necessary)
PWA 85124	Adapter, Lift
PWA 85127	Adapter, Lift And Trunnion
PWA 85133	Adapter, Lift And Trunnion
PWA 85161	Adapter, Lift

.PWA 101501	Locator, Bolt
PWA 87775	Holder, Manual
PWA 87800	Tool, Retension
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 88700	Adapter, Lift

NOTE: The PWA 86215 Wrench System has all the tools indicated below the system.

Consumable Materials:

Item No.	Designation
P06−054	Paste, Antiseize (PWA 36246)

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

CAUTION: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: TITANIUM HEATS UP MORE RAPIDLY THAN OTHER MATERIALS. TAKE EXTREME CARE WHEN HEATING TITANIUM PARTS. DO NOT EXCEED THE THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

(1) Install PWA 85127 Adapter to the tierod end of the drum rotor and blades (rear) assembly. Use PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to lift the drum rotor from the support.

(2) Assemble PWA 85593 Adapter Ring to PWA 85580 Support Stand. Place stand with ring adapter to set on adapter ring. Secure stand to adapter ring with clamps. Lower drum rotor to rest on ring adapter. Remove hoist, sling, adapters and adapter from drum rotor. See Figure 1001.

(3) Install PWA 85596 Threaded Adapter to drum rotor hub. Secure adapter to hub with clamp details. Install PWA 85427 Protector to rear hub airseal.

(4) Install PWA 85133 Adapter to the front flange of the drum rotor and blades (front) assembly. Use a Sling PWA 88643 Sling or PWA 88673 Sling with the PWA 76154 Adapters to lift the drum rotor.

(5) Position PWA 85313 Heater with PWA 29754 Control on bench heating element up. Lower drum rotor to rest on heater. Heat drum rotor rear flange to temperature not to exceed 300°F (148.9°C). See Figure 1002.

(6) Apply Antiseize Paste P06−054, to tierod threads on drum rotor (rear). Wipe off unwanted paste.

NOTE: In order to obtain proper prevailing torque, it is necessary to preassemble tierods and nuts prior to final assembly. Use PWA 87775 Manual Holder to lock tierods in place when nuts are run on tierods.

(7) When temperature of drum rotor is achieved, shut off heater and raise drum rotor (front) to position over drum rotor (rear) in assembly stand.

(8) Locate circled triangle denoting high point runout on front and rear drum snaps. Position both 180 degrees apart. Lower drum rotor, aligning tierods with tierod holes, to seat on drum rotor (rear). Remove hoist and sling with adapters.

(9) Install PWA 85255 Adapter Plate to rest on adapter on front flange of drum rotor (front). Install PWA 80513 Rod down through drums and secure to adapter in hub. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to
R ram, apply load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1003.

(10) Remove pump and gage, nut, ram, rod, adapter plate and adapter.

(11) Apply Antiseize Paste P06−054, to contact face of 12th stage tierod nuts. Wipe off unwanted paste.

(12) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 Data Acquisition Console with the PWA 86060 Data Acquisition Console and the PWA 86061 Calibration Test Stand to torque the 42 tierod nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system).

NOTE: See manufacturers data for complete use instructions.

(a) Install nuts into wrench and one by one place nuts onto each tierod.

(b) Run nuts down snug.

(13) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 1550) Tighten and torque nuts in following sequence:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Torque tierod nuts in pairs approximately 180 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m) until all nuts have been torqued to 215 − 235 lb−in. (24.292 − 26.551 N.m).

(b) FOR THESE MODELS: 4152, 4156A, 4158
Using same sequence loosen nuts and tighten to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus prevailing torque (torque required to turn nut due to self−locking feature of nut). Prevailing torque is 9.5 − 40 lb−in. (1.073 − 4.519 N.m). Then, apply angle of turn of 74 − 78 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb−in. (79.089 N.m). Remove wrench.

(14) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Reference 1560) Tighten and torque nuts in the following sequence:

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque tierod nuts in pairs approximately 180 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m) until all nuts have been torqued to 215 − 235 lb−in. (24.292 − 26.551 N.m).

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Using same sequence loosen nuts and tighten to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus prevailing torque (torque required to turn nut due to self−locking feature of nut). Prevailing torque is 9.5 − 40 lb−in. (1.073 − 4.519 N.m). Then, apply angle of turn of 74 − 78 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb−in. (79.089 N.m). Remove wrench.

(15) Position PWA 85314 Heater, connected to PWA 29754 Control, on bench heating element up.

(16) Install PWA 85161 Adapter to front hub on storage rack. Attach PWA 85086 Arm to adapter. Using hoist attached to arm, raise hub.

(17) Lower hub to rest on heater. Heat rear snap to temperature not to exceed 300°F (148.9°C). See Figure 1004.

(18) When temperature of from hub is achieved, shut off heater and raise front hub to position hub over assembly in assembly stand. Locate circled triangle denoting high point runout on front drum and front hub. Position both 180 degrees apart. Using two PWA 85256 Guide Pin, lower hub to rest on assembly. Remove pins, hoist, arm and adapter from hub.

(19) Install PWA 80513 Rod down through hub and drums and secure to adapter in rear hub. Install PWA 85255 Adapter Plate to rest on front hub tierod flange. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to
R ram, apply load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1005.

(20) Remove pump and gage, nut, ram, rod and adapter plate.

(21) Install PWA 85315 Heater, connected to PWA 29754 Control, on front hub tierod flange. Heat snap to temperature not to exceed 300°F (148.9°C). See Figure 1006.

(22) Install PWA 85163 Adapter to blades on 5th stage disk. Using hoist and PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters raise 5th stage assembly from storage rack.

(23) Apply Antiseize Paste P06-054, to threads of tierods on 5th stage. Wipe off unwanted paste.

NOTE: In order to obtain proper prevailing torque, it is necessary to preassemble tierods and nuts prior to final assembly. Use PWA 87775 Manual Holder to lock tierods in place when nuts are run on tierods.

(24) When temperature of front hub is achieved, shut off heater and remove from hub. Raise 5th stage assembly and install over hub. Locate circled triangle denoting high point runout on front hub and 5th stage disk. Position both 180 degrees apart. Lower disk aligning tierods with tierod holes. Remove hoist, sling, adapters and adapter from assembly.

(25) Install PWA 80513 Rod down through hub and drums and secure to adapter in rear hub. Install PWA 87800 Retension Tool to rest on 5th stage disk. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to ram, apply
R load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1007.

(26) Remove pump and gage, nut, ram, rod and retension tool.

(27) Apply Antiseize Paste P06-054, to contact face of 6th stage tierod nuts. Wipe off unwanted paste.

(28) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 Data Acquisition Console with the PWA 86060 Data Acquisition Console and the PWA 86061 Calibration Test Stand to torque the 42 tieord nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system).

NOTE: See manufacturers data for complete use instructions.

(a) Install nuts into wrench and one by one place nuts onto each tierod.

(b) Run nuts down snug.

(29) (Reference 1550) Tighten and torque nuts in following sequence.

(a) Torque tierod nuts in pairs approximately 180 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m) until all nuts have been torqued to 215 - 235 lb-in. (24.292 - 26.551 N.m).

(b) Using same sequence loosen nuts and tighten to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus prevailing torque (torque required to turn nut due to self−locking feature of nut). Prevailing torque is 9.5 − 40 lb−in. (1.073 − 4.519 N.m). Then, apply angle of turn of 72 − 76 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb−in. (79.089 N.m). Remove wrench.

(30) Install PWA 85161 Adapter to front hub threads and attach PWA 85086 Arm. Install hoist to arm and raise rotor.

(31) FOR THESE MODELS: 4152, 4156A, 4158
Install PWA 85124 Adapter to rear hub threads and attach PWA 85086 Arm. Using second hoist trunnion axial compressor rotor to horizontal. See Figure 1008.

(32) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Pre SB PW4ENG 72−562) Install the PWA 85124 Adapter to the rear hub threads and attach the PWA 85056 Arm. Use a second hoist and trunnion the axial compressor rotor to the horizontal position. See Figure 1008A.

(33) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Post SB PW4ENG 72−562) Install the PWA 88700 Adapter to the rear hub threads and attach the PWA 85056 Arm. Use a second hoist and trunnion the axial compressor rotor to the horizontal position. See Figure 1008A.

(34) Lower rotor on PWA 85337 Transport Stand. Remove hoist, arms and adapters. See Figure 1009.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-35-01-440-002:

1. Accomplish Runouts And Balance Rotor Assembly - Before Rotor Blade Tip Grinding - Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble axial compressor rotor assembly per Assembly-01 Task 72-35-01-440-001.

B. Equipment And Materials Required

Special Tools:

PWA 85086	Lift Arm (2 Necessary)
PWA 85124	Adapter, Lift
PWA 85159	Thread Protector
PWA 85160	Thread Protector
PWA 85161	Adapter, Lift
PWA 85403	Shroud
PWA 85406	Adapter, Drive (Optional to PWA 101714 Adapter, Drive)
PWA 85410	Weight, Front Calibration (For Balance Machines Without Electronic Calibration)
PWA 85411	Weight, Rear Calibration (For Balance Machines Without Electronic Calibration)
PWA 87959	Weight, Clamp-On (Use As Necessary, See Tables 1001 and 1002)
PWA 88575	Weight, Front Calibration (For Balance Machines Without Electronic Calibration)
PWA 101714	Adapter, Drive

C. Procedure

NOTE: Installation of HPC blade seals (ladder seals) is optional for the pre-grind balancing of the rotor assembly.

(1) Install PWA 85403 Shroud to base of HL-50 balancer. Attach PWA 85161 Adapter to front hub and PWA 85124 Adapter to rear shaft.

(2) Install two PWA 85086 Lifting Arms to HPC front and to rear adapters. Attach hoist to arms. See Figure 1001.

(3) Raise rotor from transport stand and position over cradles of balance machine with rear shaft to drive end of balance machine. Lower rotor onto cradles. Remove hoists, hub/shaft arms and adapters from rotor. Secure rotor to cradles. Remove rear shaft airseal protector.

(4) Using indicator, check runouts where indicated. See Figure 1002.

(5) Install PWA 101714 Drive Adapter onto HPC rear shaft so that splines on adapter engage splines on shaft and adapter is bottomed out against shaft. Actuate screw(s) to tighten adapter on shaft and torque screw(s) 10 - 30 lb-in. (1.130 - 3.390 N.m). Secure balance machine driveshaft to drive adapter. Cover rotor with shroud.

(6) Calibrate balance machine to 4.0 oz-in. (2880 g.mm) in Plane AL and 5.0 oz-in. (3600 g.mm) in Plane AJ.

(a) For balance machines without electronic calibration, do a check of the static balance machine.

R R R 1 Install the PWA 88575 Calibration Weight on the Front HPC Rotor at Plane AL. Plane AL balance is moved to the location shown in Figure 1003.

R R 2 Install the PWA 85411 Calibration Weight at Plane AJ Stage 15 disk. See Figure 1003.

3 Calibrate balance machine.

4 After you calibrate the balance machine, remove the calibration weights.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(7) Measure the initial unbalance.

(a) Balance the axial compressor rotor assembly at 900 RPM minimum in Planes AL and AJ when mounted on Diameters F and C.

(b) The initial unbalance must not be more than 30 oz-in. (21600 g.mm) for Plane AL and 30 oz-in. (21600 g.mm) for Plane AJ if the unbalance vectors are not within 30 degrees of each other. However, if the unbalance vectors are within 30 degrees of each other, the intial unbalance must not be more than 16 oz-in. (11520 g.mm) for Plane AL and 16 oz-in. (11520 g.mm) for Plane AJ.

(c) If initial unbalance is not met, recheck runout. Runout must be within allowable limits. If it is not, check bolted joints for proper seating. If, after check, initial unbalance is not met, subassemblies may be rotated to meet this requirement. In addition, Stage 15 blades can be removed and installed light to heavy to meet the requirement.

(8) When the initial unbalance requirement is satisfied, balance the axial compressor rotor at 900 rpm minimum to less than 0.4 oz−in. (288. g.mm) in Planes AL and AJ when mounted on Diameters F and C.

APPROXIMATE CLAMP−ON WEIGHT MOMENT VALUES

CLASS	MEASURED WEIGHT	MOMENT WEIGHT
1	0.162 OZ (4593. mg)	1.600 oz−in. (1152. g.mm)
2	0.209 OZ (5925. mg)	2.100 oz−in. (1512. g.mm)
3	0.307 OZ (3.000 mg)	3.000 oz−in. (2160. g.mm)
4	0.190 OZ (1.850 mg)	1.850 oz−in. (1332. g.mm)
6	0.194 OZ (5500. mg)	1.900 oz−in. (1368. g.mm)
8	0.256 OZ (7257. mg)	2.500 oz−in. (1800. g.mm)
10	0.272 OZ (7711. mg)	2.700 oz−in. (1944. g.mm)
12	0.293 OZ (8306. mg)	2.900 oz−in. (2088. g.mm)
14	0.384 OZ (10886. mg)	3.800 oz−in. (2736. g.mm)

Moment Weight Values For PWA 87959 Clamp−On
Counterweight When Used At Plane AL
Table 1001

APPROXIMATE CLAMP−ON WEIGHT MOMENT VALUES

CLASS	MEASURED WEIGHT	MOMENT WEIGHT
1	0.162 OZ (4593. mg)	1.600 oz−in. (1152. g.mm)
2	0.209 OZ (5925. mg)	2.000 oz−in. (1440. g.mm)
3	0.307 OZ (3.000 mg)	2.950 oz−in. (2124. g.mm)
4	0.190 OZ (1.850 mg)	1.800 oz−in. (1296. g.mm)
6	0.194 OZ (5500. mg)	1.900 oz−in. (1368. g.mm)
8	0.256 OZ (7257. mg)	2.500 oz−in. (1800. g.mm)
10	0.272 OZ (7711. mg)	2.700 oz−in. (1944. g.mm)
12	0.293 OZ (8306. mg)	2.900 oz−in. (2088. g.mm)
14	0.384 OZ (10886. mg)	3.700 oz−in. (2664. g.mm)

Moment Weight Values For PWA 87959 Clamp−On
Counterweight When Used At Plane AJ
Table 1002

(a) Use the method that follows to correct the balance at Plane AL by the installation of PWA 87959 Clamp−On Balance Weights to the 5th stage airseal.

1 Find the number of clamp−on counterweights that are necessary to correct the unbalance of Plane AL. Refer to Table 1001.

R 2 Install and tighten the clamp−on weights on the 5th stage airseal. See Figure 1003.

NOTE: Install the weights with the cap screw between the airseals and the weight clamped against the ID wall of the 5th stage airseal.

(b) Use the method that follows to correct the balance at Plane AJ by the installation of PWA 87959 Clamp−On Balance Weights to the balance flange on the rear drum.

1 Find the number of clamp−on counterweights that are necessary to correct the unbalance of Plane AJ. Refer to Table 1002.

R 2 Install and tighten the clamp−on weights on the rear counterweight flange. See Figure 1003.

NOTE: Install the weights with the cap screw on the OD of the flange and the weight clamped against the ID wall of the rear counterweight flange.

(9) Make a record of the total number of clamp−on weights that are installed on each plane (Planes AL and AJ).

(10) Disconnect drive unit and remove from shaft.

(11) Remove the machine details that hold the rotor in the balance machine.

(12) Install PWA 85124 Lift Adapter to rear shaft and PWA 85161 Lift Adapter to front hub.

(13) Install PWA 85086 Arm to HPC front hub. Attach hoist to arm. Install PWA 85086 Arm to rear shaft. Attach hoist to arm. See Figure 1001.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−02

(14) Raise rotor from balance machine and lower into PWA 85337 Transport Stand. Remove hoists, arms and adapters. See Figure 1004.

(15) Install PWA 85160 Thread Protector to front hub and PWA 85159 Thread Protector to rear shaft.

(16) Install PWA 85428 Protector on rear shaft airseal.

D. Postrequisites

(1) For operators that elect to blade tip grind the HPC rotor assembly, grind the rotor by 72−35−01, Assembly−03Task 72−35−01−440−003.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-02

Task 72-35-01-440-005:

1. Accomplish Runouts And Balance Rotor Assembly - Before Rotor Blade Tip Grinding - Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble axial compressor rotor assembly by Assembly-01 Task 72-35-01-440-001.

B. Equipment And Materials Required

Special Tools:

PWA 85086	Lift Arm (2 Necessary)
PWA 85124	Adapter, Lift
PWA 85159	Thread Protector
PWA 85160	Thread Protector
PWA 85161	Adapter, Lift
PWA 85403	Shroud
PWA 87959	Weight, Clamp-On (Use As Necessary, See Tables 1001 And 1002)
PWA 88575	Weight, Front Calibration (For Balance Machines Without Electronic Calibration)
PWA 88576	Weight, Rear Calibration (For Balance Machines Without Electronic Calibration)
PWA 88700	Adapter, Lift
PWA 101714	Adapter, Drive

C. Procedure

NOTE: Installation of HPC blade seals (ladder seals) is optional for the pre-grind balancing of the rotor assembly.

R (1) Install the PWA 85403 Shroud to the base of the HL-50
R balancer. Attach the PWA 85161 Adapter to the front
R hub and PWA 85124 Adapter and PWA 88700 Adapter to the
R rear shaft.

(2) Install two PWA 85086 Lifting Arms to the HPC front and to the rear adapters. Attach hoist to arms. See Figure 1001.

(3) Lift the rotor from the transport stand and position over the cradles of the balance machine with the rear shaft to the drive end of the balance machine. Lower the rotor to the cradles. Remove hoists, hub/shaft arms and adapters from the rotor. Attach the rotor to the cradles. Remove the rear shaft airseal protector.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-02

(4) Use an indicator and check the runouts where shown. See Figure 1002.

(5) Install the PWA 101714 Drive Adapter to the HPC rear shaft so that the splines on the adapter engage the splines on the shaft and the adapter is seated against the shaft. Actuate the screw(s) to tighten the adapter on the shaft. Torque the screw(s) to 10 - 30 lb-in. (1.130 - 3.390 N.m). Install the balance machine driveshaft to the drive adapter. Cover the rotor with the shroud.

(6) Calibrate balance machine to 4.0 oz-in. (2880 g.mm) in Plane AL and 5.0 oz-in. (3600 g.mm) in Plane AJ.

(a) For balance machines without electronic calibration, do a check of the static balance machine.

1 Install PWA 88575 Front HPC Rotor Calibration Weight over the front knife-edge seal at Plane AL, Stage 5 disk, with screw outboard. Balance Plane AL on Stage 5 disk is shown in Figure 1003. R R

2 Install PWA 88576 Calibration Weight to the balance flange at Plane AJ on the Stage 15 disk. See Figure 1003. R

3 Calibrate balance machine.

4 After you calibrate the balance machine, remove the calibration weights.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(7) Measure the initial unbalance.

(a) Balance the axial compressor rotor assembly at 900 RPM minimum in Planes AL and AJ when mounted on Diameters F and C.

(b) The initial unbalance must not be more than 30 oz−in. (21600 g.mm) for Plane AL and 30 oz−in. (21600 g.mm) for Plane AJ if the unbalance vectors are not within 30 degrees of each other. However, if the unbalance vectors are within 30 degrees of each other, the intial unbalance must not be more than 16 oz−in. (11520 g.mm) for Plane AL and 16 oz−in. (11520 g.mm) for Plane AJ.

(c) If the initial unbalance is not met, check the runout again. The runout must be within permitted limits. If it is not, check the bolted joints for correct seating. If, after you check the runout again and you still cannot get the initial unbalance, subassemblies can be turned to get the initial unbalance. Stage 15 blades can be removed and installed, light to heavy, to get the initial unbalance.

(8) When the initial unbalance requirement is satisfied, balance the axial compressor rotor at 900 rpm minimum to less than 0.4 oz−in. (288. g.mm) in Planes AL and AJ when mounted on Diameters F and C.

APPROXIMATE CLAMP−ON WEIGHT MOMENT VALUES

CLASS	MEASURED WEIGHT	MOMENT WEIGHT
1	0.162 OZ (4593. mg)	1.600 oz−in. (1152. g.mm)
2	0.209 OZ (5925. mg)	2.100 oz−in. (1512. g.mm)
3	0.307 OZ (3.000 mg)	3.000 oz−in. (2160. g.mm)
4	0.190 OZ (1.850 mg)	1.850 oz−in. (1332. g.mm)
6	0.194 OZ (5500. mg)	1.900 oz−in. (1368. g.mm)
8	0.256 OZ (7257. mg)	2.500 oz−in. (1800. g.mm)

10	0.272 OZ (7711. mg)	2.700 oz-in. (1944. g.mm)
12	0.293 OZ (8306. mg)	2.900 oz-in. (2088. g.mm)
14	0.384 OZ (10886. mg)	3.700 oz-in. (2664. g.mm)

Moment Weight Values For PWA 87959 Clamp-On
Counterweight When Used At Plane AJ
Table 1002

(a) Use the method that follows to correct the balance at Plane AL by the installation of PWA 87959 Clamp-On Balance Weights to the 5th stage airseal.

1 Find the number of clamp-on counterweights that are necessary to correct the unbalance of Plane AL. Refer to Table 1001.

R 2 Install and tighten the clamp-on weights on the 5th stage airseal. See Figure 1003.

NOTE: Install the weights with the cap screw between the airseals and the weight clamped against the ID wall of the 5th stage airseal.

(b) Use the method that follows to correct the balance at Plane AJ by the installation of PWA 87959 Clamp-On Balance Weights to the balance flange on the rear drum.

1 Find the number of clamp-on counterweights that are necessary to correct the unbalance of Plane AJ. Refer to Table 1002.

R 2 Install and tighten the clamp-on weights on the rear counterweight flange. See Figure 1003.

NOTE: Install the weights with the cap screw on the OD of the flange and the weight clamped against the ID wall of the rear counterweight flange.

(9) Make a record of the total number of clamp-on weights that are installed on each plane (Planes AL and AJ).

(10) Disconnect drive unit and remove from shaft.

(11) Remove the machine details that hold the rotor in the balance machine.

(12) Disconnect the drive unit and remove from the shaft. (Pre SB PW4ENG 72-562) Install PWA 85124 Adapter to the rear shaft and PWA 85161 Adapter to the front hub. (Post SB PW4ENG 72-562) Install the PWA 88700 Adapter to the rear shaft and the PWA 85161 Adapter to the front hub.

(13) Install PWA 85086 Arm to HPC front hub. Attach hoist to arm. Install PWA 85086 Arm to rear shaft. Attach hoist to arm. See Figure 1001.

(14) Raise rotor from balance machine and lower into PWA 85337 Transport Stand. Remove hoists, arms and adapters. See Figure 1004.

(15) Install PWA 85160 Thread Protector to the front hub and PWA 85159 Thread Protector to the rear shaft.

(16) Install PWA 85428 Protector on the rear shaft airseal.

D. Postrequisites

(1) For operators that want to blade tip grind the HPC rotor assembly, grind the rotor by 72-35-01, Assembly-03 Task 72-35-01-440-003.

Task 72-35-01-440-003:

1. Grind And Measure The Axial Compressor Rotor Assembly Blade Tips (Vendor Application - Informational Release)

A. Purpose

(1) The purpose of this procedure is to control HPC rotor blade tip clearances by grinding rotor blade tip diameters.

NOTE: The measurements of the blade tip diameters provided by this procedure can be used to find the continued serviceability of the rotor assembly. These measurements are used to calculate blade tip clearances in 72-35-00, Inspection/Check-05, CONFIG-01 (Task 72-35-00-200-005).

B. Prerequisites

(1) Balance axial compressor rotor assembly by 72-35-01, Assembly-02 Task 72-35-01-440-002 or Task 72-35-01-440-005.

C. Procedure

CAUTION: EXCEPT FOR WORK OR SUPPLIES TO BE PERFORMED
R OR FURNISHED BY PRATT & WHITNEY, PRATT & WHITNEY DOES NOT ENDORSE THE WORK PERFORMED BY THE COMPANY OR COMPANIES NAMED HEREIN OR ANY OTHER COMPANY AND DOES NOT ACCEPT RESPONSIBILITY TO ANY DEGREE FOR THE SELECTION OF SUCH COMPANY OR COMPANIES FOR THE PERFORMANCE OF ANY WORK OR PROCUREMENT OF SUPPLIES.

R (1) This is a source demonstration procedure. Send
R repairable parts to an approved source licensed for
R this repair. The list that follows identifies sources
R approved and licensed for this repair by source code
R number. Refer to the source code list in Section
R 70-40-00, General-01 (Task 70-40-00-990-001) in
R the Pratt & Whitney Standard Practices Manual (PN
R 585005) and the supplemental repair source list in the
R Introduction section of this manual for the company

R name, address and contact information identified by
R each source code.

(3) The vendor shall provide a record that shows the average size, number of blades, minimum and maximum blades identified and the variations from the blade average tip radius.

Acceptable Blade Tip Radius Measurements:

Stage No.	Nom. Blade Tip Radius Inches (Millimeters)	Dev. Of Avg. Blade Tip Radius From Nominal Inches (Millimeters)	Max. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)	Min. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)
5	16.360 (415.544)	Accept As Is (c)		
6	15.443 (392.252)	Accept As Is (c)		

Acceptable Blade Tip Radius Measurements:

Stage No.	Nom. Blade Tip Radius Inches (Millimeters)	Dev. Of Avg. Blade Tip Radius From Nominal Inches (Millimeters)	Max. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)	Min. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)
7	14.9426 (379.542)	Accept As Is (c)		
8	14.5549 (369.694)	Accept As Is (c)		
9	14.347 (364.414)	+0.011/-0.004 (+0.279/-0.102)	+0.003(a) (+0.076)(a)	-0.003(b)(c) (-0.076)(b)(c)
10	14.1454 (359.293)	+0.012/-0.005 (+0.305/-0.127)	+0.003(a) (+0.076)(a)	-0.003(b)(c) (-0.076)(b)(c)
11	13.9457 (354.221)	+0.012/-0.005 (+0.305/-0.127)	+0.003(a) (+0.076)(a)	-0.003(b)(c) (-0.076)(b)(c)
12(e)	13.7876 (350.205)	+0.012/-0.005 (+0.305/-0.127)	+0.003(a) (+0.076)(a)	-0.003(b)(c) (-0.076)(b)(c)
12(d)	13.7893 (350.248)	+0.012/-0.005 (+0.305/-0.127)	+0.003(a) (+0.076)(a)	-0.003(b)(c) (-0.076)(b)(c)
13	13.6096 (345.684)	+/-0.001(a) (+/-0.025)(a)	+0.001 (+0.025)	-0.001 (-0.025)
14	13.5523 (344.228)	+/-0.001(a) (+/-0.025)(a)	+0.001 (+0.025)	-0.001 (-0.025)
15	13.5109 (343.177)	+/-0.001(a) (+/-0.025)(a)	+0.001 (+0.025)	-0.001 (-0.025)

(a) This tolerance is from the measured and calculated average blade tip radius. A maximum of seven blades for each stage can be at this maximum.

(b) This tolerance is from the measured and calculated average blade tip radius.

(c) Extended minimum radius limit:

(1) A maximum of five blades for each stage can be -0.003 inch (-0.077 mm) to -0.007 inch (-0.177 mm) shorter than the measured and calculated average blade tip radius.

Acceptable Blade Tip Radius Measurements:

Stage No.	Nom. Blade Tip Radius Inches (Millimeters)	Dev. Of Avg. Blade Tip Radius From Nominal Inches (Millimeters)	Max. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)	Min. Dev. Of Indiv. Blades From Avg. Inches (Millimeters)

(CONTINUED)

(2) If five blades fall within the -0.003 inch (-0.077 mm) to -0.007 inch (-0.177 mm) range, the sixth shortest blade will be reported as the new minimum blade.

(3) If less than five blades fall within the -0.003 inch (-0.077 mm) to -0.007 inch (-0.177 mm) range, the next shortest blade above this range will be reported as the new minimum blade.

(4) In the event there are three short blades adjacent to one another that fall within the -0.003 inch (-0.077 mm) to -0.007 inch (-0.177 mm) range, the longest of the three blades will be reported as the new minimum blade.

(d) PN 57H478, 56H378, 58H578

(e) PN 57H678, 54H668

NOTE: For Stages 9 through 12, the measured average can vary up to the limits shown if the minimum local, maximum local and average clearances are within the engine manual limits. In the event that the minimum local and/or average clearances are under the minimum limits, the mating rubstrip can be skim cut to remove up to 0.007 inch (0.178 mm) radially. See 72-35-00, Repair-01 (Task 72-35-00-300-001).

(4) For permitted damage after grind refer to 72-35-01, Inspection/Check-03 (Task 72-35-01-200-003) for limits.

D. Postrequisites

(1) Final balance axial compressor rotor assembly by 72-35-01, Assembly-04 (Task 72-35-01-440-004).

Task 72-35-01-440-026:

1. Grind And Measure The Axial Compressor Rotor Assembly Blade Tips (Ring Case Configuration, Post SB PW4ENG 72-756 Or Post SB PW4ENG 72-759) (Vendor Application - Informational Release)

A. Purpose

(1) The purpose of this procedure is to control HPC rotor blade tip clearances by grinding rotor blade tip diameters.

NOTE: The measurements of the blade tip diameters provided by this procedure can be used to find the continued serviceability of the rotor assembly. These measurements are used to calculate blade tip clearances in 72-35-00, Inspection/Check-05, CONFIG-2 (Task 72-35-00-990-012).

B. Prerequisites

(1) Balance Axial Compressor Rotor Assembly. Refer to 72-35-01, Assembly-02 (Task 72-35-01-440-002) or (Task 72-35-01-440-005).

C. Procedure

CAUTION: EXCEPT FOR WORK OR SUPPLIES TO BE PERFORMED OR FURNISHED BY PRATT & WHITNEY, IT IS UNDERSTOOD THAT PRATT & WHITNEY DOES NOT ENDORSE THE WORK PERFORMED BY THE COMPANY OR COMPANIES NAMED HEREIN OR ANY OTHER COMPANY AND DOES NOT ACCEPT RESPONSIBILITY TO ANY DEGREE FOR THE SELECTION OF SUCH COMPANY OR COMPANIES FOR THE PERFORMANCE OF ANY WORK OR PROCUREMENT OF SUPPLIES.

R (1) This is a source demonstration procedure. Send

Blade Tip Radius Measurements (For Compressors With The Ring Case Configuration)
Table 1001

Stage	Nominal Blade Tip Radius Inches (mm)	Re−Target Allowance From The Nominal Radius Inches (mm)	Maximum Deviation Of Individual Blades From Aveage Inch (mm)	Minimum Deviation Of Individual Blades From Aveage Inch (mm)
7	14.943 (379.552)	Not Applicable	Not Applicable	Not Applicable (a)
8	14.538 (369.265)	Not Applicable	Not Applicable	Not Applicable (a)
9	14.338 (364.185)	+0.010/−0.005 +(0.254)/ −(0.127)	+0.001 +(0.025)	−0.001 (b) −(0.025) (b)
10	14.139 (359.131)	+0.010/−0.005 +(0.254)/ −(0.127)	+0.001 +(0.025)	−0.001 (b) −(0.025) (b)
11	13.950 (354.330)	+0.010/−0.005 +(0.254)/ −(0.127)	+0.001 +(0.025)	−0.001(b) −(0.025)(b)
12	13.797 (350.444)	+0.010/−0.005 +(0.254)/ −(0.127)	+0.001 +(0.025)	−0.001(b) −(0.025)(b)
13	13.609 (345.669)	±0.005 ±(0.127)	+0.001 +(0.025)	−0.001(b) −(0.025)(b)
14	13.556 (344.322)	±0.005 ±(0.127)	+0.001 +(0.025)	−0.001(b) −(0.025)(b)
15	13.515 (343.281)	±0.005 ±(0.127)	+0.001 +(0.025)	−0.001(b) −(0.025)(b)

(a) Extended minimum radius limit (Stages 5 Through 8):

(1) A maximum of five blades for each stage can be −0.004 inch (−0.102 mm) to −0.007 inch (−0.177 mm) shorter than the measured and calculated average blade tip radius.

(2) If five blades fall within the −0.004 inch (−0.102 mm) to −0.007 inch (−0.177 mm) range,

Blade Tip Radius Measurements (For Compressors With The Ring Case Configuration)
Table 1001 (Continued)

Stage	Nominal Blade Tip Radius Inches (mm)	Re−Target Allowance From The Nominal Radius Inches (mm)	Maximum Deviation Of Individual Blades From Aveage Inch (mm)	Minimum Deviation Of Individual Blades From Aveage Inch (mm)
(CONTINUED)				

the sixth shortest blade will be reported as the new minimum blade.

(3) If less than five blades fall within the −0.004 inch (−0.102 mm) to −0.007 inch (−0.177 mm) range, the next shortest blade above this range will be reported as the new minimum blade.

(4) In the event there are three short blades adjacent to one another that fall within the −0.004 inch (−0.102 mm) to −0.007 inch (−0.177 mm) range, the longest of the three blades will be reported as the new minimum blade.

(b) Extended minimum radius limit (Stages 9 Through 15):

(1) A maximum of five blades for each stage can be −0.002 inch (−0.051 mm) to −0.010 inch (−0.254 mm) shorter than the nominal blade tip radius specified above.

(2) If five blades fall within the −0.002 inch (−0.051 mm) to −0.010 inch (−0.254 mm) range, the sixth shortest blade will be reported as the new minimum blade.

(3) If less than five blades fall within the −0.002 inch (−0.051 mm) to −0.010 inch (−0.254 mm) range, the next shortest blade above this range will be reported as the new minimum blade.

(4) In the event there are three short blades adjacent to one another that fall within the −0.002 inch (−0.051 mm) to −0.010 inch (−0.254 mm) range, the longest of the three blades will be reported as the new minimum blade.

NOTE: For Stages 9 through 15, the nominal rotor grind dimension can be re−targeted by the amount shown in

Blade Tip Radius Measurements (For
Compressors With The Ring Case Configuration)
Table 1001 (Continued)

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-03

Stage	Nominal Blade Tip Radius Inches (mm)	Re-Target Allowance From The Nominal Radius Inches (mm)	Maximum Deviation Of Individual Blades From Aveage Inch (mm)	Minimum Deviation Of Individual Blades From Aveage Inch (mm)

(CONTINUED)

Table 1001 provided the mating air seal rub-strips are re-targeted by the same amount. Refer to 72-35-04, Assembly-02 (Task 72-35-04-440-002).

Blade Tip Radius Measurements (For Compressors With The Ring Case Configuration)
Table 1001 (Continued)

(4) For permitted damage after grind, refer to 72-35-01, Inspection/Check-03 (Task 72-35-01-200-003) for limits.

D. Postrequisites

(1) Final Balance The Axial Compressor Rotor Assembly. Refer to 72-35-01, Assembly-04 (Task 72-35-01-440-004).

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-04

Task 72-35-01-440-004:

1. Final Balance Axial Compressor Rotor Assembly (After The Blade Tip Grinding Operation)

A. Prerequisites

(1) Grind the axial compressor rotor assembly blade tips per Assembly-03 Task 72-35-01-440-003.

B. Equipment And Materials Required

Special Tools:

PWA 76154	Adapters (2 Required)
PWA 78064	Gage
PWA 80515	Stand
PWA 85086	Arm (2 Required)
PWA 85124	Adapter, Lift
PWA 85159	Thread Protector
PWA 85160	Thread Protector
PWA 85161	Adapter
PWA 85294	Adapter
PWA 85337	Stand
PWA 85403	Shroud
PWA 85406	Adapter, Drive (Optional to PWA 101714 Adapter, Drive)
PWA 85410	Weight, Front Calibration (For Balance Machines Without Electronic Calibration)
PWA 85411	Weight, Rear Calibration (For Balance Machines Without Electronic Calibration)
PWA 85428	Thread Protector
PWA 85528	Adapter, Handling
PWA 85529	Nut
PWA 85530	Wrench
PWA 85531	Adapter

PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 88700	Adapter, Lift
PWA 101714	Adapter, Drive

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−04

Consumable Materials:

Item No.	Designation
P09−014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	A/R	79−35−00/10/20

C. Procedure

NOTE: Installation of HPC blade seals (ladder seals) was optional for the pre−grind balancing of the rotor assembly.

(1) Remove all clamp−on weights that were installed for the initial balance operation (before blade tip grind).

  (a) Check the record to find how many weights were installed at the before blade tip grind balance operation and, if any, during the blade tip grind operation.

  (b) Be sure that the same number of weights that were installed are also removed.

(2) Attach PWA 85161 Adapter to front hub and PWA 85124 Adapter to rear shaft. Install two PWA 85086 Lifting Arms to HPC front and to rear adapters. Attach hoist to arms. See Figure 1001.

(3) Install PWA 85403 Shroud to base of HL−50 balancer. See Figure 1002 (Sheet 1).

(4) Raise rotor from transport stand and position over cradles of balance machine with rear shaft to drive end of balance machine. Lower rotor onto cradles. Remove hoists, hub/shaft arms and adapters from rotor. Install the machine details that hold the rotor in the balance machine. Secure rotor to cradles. Remove rear shaft airseal protector.

(5) Using indicator, check runouts where indicated. See Figure 1002.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−04

(6) Install PWA 101714 Drive Adapter onto HPC rear shaft so that splines on adapter engage splines on shaft and adapter is bottomed out against shaft. Actuate screw(s) to tighten adapter on shaft and torque screw(s) 10 − 30 lb−in. (1.130 − 3.390 N.m). Secure balance machine driveshaft to drive adapter. Cover rotor with shroud.

(7) Calibrate balance machine to 4.0 oz−in. (2880 g.mm) in Plane AL and 5.0 oz−in. (3600 g.mm) in Plane AJ.

(a) For balance machines without electronic calibration, do a check of the static balance machine.

1 Install PWA 88575 Calibration Weight on Front HPC Rotor at Plane AL. Balance Plane AL is moved to the location shown on Figure 1003 (Sheet 1).

2 Install PWA 85411 Calibration Weight at Plane AJ Stage 15 disk. See Figure 1003 (Sheet 2).

3 Calibrate balance machine.

4 After you calibrate the balance machine, remove the calibration weights.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(8) Balance axial compressor rotor assembly at 900 rpm minimum in Planes AL and AJ when mounted on Diameters F and C.

(a) Initial unbalance shall not exceed 30 oz−in. (21600 g.mm) per plane or 15 oz−in. (10800 g.mm) per plane, if unbalance vectors are within 30 degrees of each other.

(b) If initial unbalance is not met, recheck runout. Runout must be within allowable limits. If it is not, check bolted joints for proper seating. If, after check, initial unbalance is not met, subassemblies may be rotated to meet this requirement. In addition, Stage 15 blades can be removed and installed light to heavy to meet the requirement.

(c) Once the initial unbalance requirement is satisfied, balance the rotor at 900 rpm minimum to the following requirements:

1 For final dynamic balancing of the rotor, either after rotor tip grinding (for operators that elect to tip grind the HPC rotor assembly) or for final rotor dynamic balance when rotor is not being ground, the remaining unbalance must be within 0.2 oz−in. (144 g.mm) at the front Plane AL and within 0.5 oz−in. (360 g.mm) at the rear Plane AJ.

(d) Balance correction at Plane AL (HPC forward end):

1 Balance Plane AL shown in Figure 1003 (Sheet 1). Correct balance by addition of one counterweight PN 54H737, PN 54H738 or PN 54H739 to the bottom of a 5th stage blade, at as many blade locations as necessary. Remove sealant from around 5th stage blade lock and remove lock with a non−metallic drift and discard. Remove 5th stage blade and remove sealant from 5th stage blade root to permit installation of the counterweight. Also, remove sealant from slot in 5th stage disk in the area where the blade was removed. Apply Silicone Rubber Sealant P09−014 as shown in Figure 1003 (Sheet 1) to counterweight. Place counterweight with sealant to the bottom of the blade root. Sealant cure is waived. Apply Silicone Rubber Sealant P09−014 to the blade lock groove in the blade and the disk. Install the blade and secure with a new blade lock. Apply Silicone Rubber Sealant P09−014 to cover the blade lock bent end.

CAUTION: COUNTERWEIGHTS MUST NOT BE INSTALLED AT LOADING SLOT LOCATIONS. BLADES MAY BE DAMAGED AT THESE LOCATIONS. TOTAL QUANTITY OF COUNTERWEIGHTS ALLOWED INCLUDES QUANTITY USED IN SUBASSEMBLY BALANCING.

(e) Balance correction at Plane AJ (HPC aft end): Correct balance by adding counterweights PN 51H476 at Stage 15 within quantities specified. See Figure 1003 (Sheet 2). In addition to adding counterweights to Stage 15, counterweights can be installed to Stage 13, see Figure 1003 (Sheet 3). After the counterweights have been added remeasure balance in Plane AJ.

CAUTION: SETSCREW CHANGE LETTER C AND LOCK CHANGE LETTER C AND LOCK AND SETSCREW ASSEMBLY CHANGE LETTER A MUST BE SECURED BY LOCKING SETSCREW TO RUNNING TORQUE PLUS 4 − 8 LB−IN. (0.452 − 0.904 N.m).

(9) Blade lock screws must not rotate under 10 lb−in. (1.130 N.m) of applied torque. If screw rotates then retorque setscrew to running torque plus 8 − 12 lb−in. (0.904 − 1.356 N.m).

(10) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(11) Disconnect drive unit and remove from shaft. Install PWA 85124 Adapter to rear shaft and PWA 85161 Adapter to front hub.

(12) Install PWA 85086 Arm to HPC front hub. Attach hoist to arm. Install PWA 85086 Arm to rear shaft. Attach hoist to arm. See Figure 1001.

(13) If rotor is to be stored for a period of time, raise rotor from balance machine and lower into PWA 85337 Transport Stand. Remove hoists, arms and adapters. See Figure 1004.

(a) Install PWA 85160 Thread Protector to front hub and PWA 85159 Thread Protector to rear shaft.

(b) Install PWA 85428 Protector on rear shaft airseal.

(14) If rotor is not to be stored, trunnion rotor assembly to front end up position. Remove hoist, arm, and adapter from rear shaft. Lower rotor assembly into PWA 85580 Stand with PWA 80515 Stand, PWA 85294 Adapter and PWA 85593 Adapter. Remove hoist, arm, and adapter from front hub. See Figure 1005.

(15) Install PWA 85528 Adapter with PWA 85537 Fixture to HPC front hub. Secure fixture and adapter with PWA 85529 Nut. Using PWA 85530 Wrench and PWA 85531 Adapter, torque nut to 300 lb−in. (33.895 N.m). See Figure 1006.

(16) Install PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to spools of fixture and raise rotor from stand. Install PWA 85124 Adapter to rear shaft. Install PWA 85086 Arm to adapter and using hoist trunnion rotor to front end down. See Figure 1007.

(17) Lower rotor assembly onto PWA 87022 Stand. Remove hoist, arm and adapter from rear hub. See Figure 1008.

Task 72−35−01−440−006:

1. Final Balance Axial Compressor Rotor Assembly (After The Blade Tip Grinding Operation)

A. Prerequisites

(1) Grind the axial compressor rotor assembly blade tips by Assembly−03 Task 72−35−01−440−003.

B. Equipment And Materials Necessary

Special Tools:

PWA 76154	Adapters (2 Necessary)
PWA 78064	Gage
PWA 80515	Stand
PWA 85086	Arm (2 Necessary)
PWA 85124	Adapter, Lift
PWA 85159	Thread Protector
PWA 85160	Thread Protector
PWA 85161	Adapter
PWA 85294	Adapter
PWA 85337	Stand
PWA 85403	Shroud
PWA 85428	Thread Protector
PWA 85528	Adapter, Handling
PWA 85529	Nut
PWA 85530	Wrench
PWA 85531	Adapter
PWA 85537	Fixture, Handling (For Compressors With A Symmetric Case)
PWA 85580	Stand, Support
PWA 85593	Ring, Adapter
PWA 87022	Stand, Build And Storage
PWA 87492	Riveter (Optional to PWA 100002)
PWA 88560	Fixture, Handling (For Compressors With An Asymmetric Case)
PWA 88575	Weight, Front Calibration (For Balance Machines Without Electronic Calibration)
PWA 88576	Weight, Rear Calibration (For Balance Machines Without Electronic Calibration)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 88700	Adapter, Lift
PWA 100002	Riveter
PWA 101714	Adapter, Drive

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−04

Consumable Materials:

Item No.	Designation
P09−014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	A/R	79−35−00/10/20

C. Procedure

NOTE: Installation of HPC blade seals (ladder seals) was optional for the pre−grind balancing of the rotor assembly.

(1) Remove all clamp−on weights that were installed for the initial balance operation (before blade tip grind).

(a) Check the record to find how many weights were installed at the before blade tip grind balance operation and, if any, during the blade tip grind operation.

(b) Be sure that the same number of weights that were installed are also removed.

(2) (Pre SB PW4ENG 72−562) Attach PWA 85161 Adapter to the front hub and PWA 85124 Adapter to the rear shaft. (Post SB PW4ENG 72−562) Attach the PWA 85161 Adapter to the front hub and the PWA 88700 Adapter to the rear shaft. See Figure 1001.

(3) Install two PWA 85086 Lifting Arms to the HPC front and to the rear adapters. Attach hoist to arms. See Figure 1001.

(4) Install PWA 85403 Shroud to base of HL−50 balancer. See Figure 1002 (Sheet 1).

(5) Lift the rotor from the transport stand and position over the cradles of the balance machine with the rear shaft to the drive end of the balance machine. Lower the rotor to the cradles. Remove hoists, hub/shaft arms and adapters from the rotor. Attach the rotor to the cradles. Remove the rear shaft airseal protector.

(6) Use an indicator and check the runouts where shown. See Figure 1002.

(7) Install the PWA 101714 Drive Adapter to the HPC rear shaft so that the splines on the adapter engage the splines on the shaft and the adapter is seated against the shaft. Actuate the screw(s) to tighten the adapter on the shaft. Torque the screw(s) to 10 − 30 lb−in. (1.130 − 3.390 N.m). Install the balance machine driveshaft to the drive adapter. Cover the rotor with the shroud.

(8) Calibrate balance machine to 4.0 oz−in. (2880 g.mm) in Plane AL and 5.0 oz−in. (3600 g.mm) in Plane AJ.

(a) For balance machines without electronic calibration, do a check of the static balance machine.

1 Install PWA 88575 Front HPC Rotor Calibration Weight over the front knife−edge seal, with screw outboard. Balance Plane AL is shown on Figure 1003 (Sheet 1).

2 Install PWA 88576 Calibration Weight to the balance flange at Plane AJ on the Stage 15 disk. See Figure 1003 (Sheet 2).

3 Calibrate balance machine.

4 After you calibrate the balance machine, remove the calibration weights.

(b) For balance machines with electronic calibration, use the manufacturer's instructions to do a check of the static balance machine.

(9) Balance the axial compressor rotor assembly at 900 rpm minimum in Planes AL and AJ when mounted on Diameters F and C.

(a) Initial unbalance must not be more than 30 oz−in. (21600.0 g.mm) for each plane or 16 oz−in. (11520.0 g.mm) for each plane if the unbalance vectors are within 30 degrees of each other.

(b) If the initial unbalance is not met, check the runout again. The runout must be within permitted limits. If it is not, check the bolted joints for correct seating. If, after you check the runout again and you still cannot get the initial unbalance, subassemblies can be turned to get the initial unbalance. Stage 15 blades can be removed and installed, light to heavy, to get the initial unbalance.

(c) When you get the initial unbalance, balance the rotor at 900 rpm minimum to the limits that follow:

1 For final dynamic balancing of the rotor, after rotor tip grinding (for operators that want to tip grind the HPC rotor assembly) or for final rotor dynamic balance when the rotor will not be ground, the remaining unbalance must be within 0.20 oz−in. (144.0 g.mm) at the front Plane AL and within 0.50 oz−in. (360.0 g.mm) at the rear Plane AJ.

(d) (Post SB PW4ENG 72−515) Engines with an integrated inlet airseal and Stage 5 disk, (with balance flange removed) balance correction at Plane AL (HPC forward end) as follows:

NOTE: Balance Plane AL is moved to the location shown in Figure 1003 (Sheet 1).

1 Correct the balance by the installation of one counterweight (PN 54H737, PN 54H738 or PN 54H739) to the bottom of a 5th stage blade, at as many blade locations as necessary.

2 Remove sealant from around 5th stage blade lock and remove lock with a non−metallic drift and discard.

3 Remove the 5th stage blade. Remove the sealant from the 5th stage blade root to permit installation of the counterweight. Remove the sealant from the slot in the 5th stage disk in the area where the blade was removed.

4 Apply Silicone Rubber Sealant P09−014 as shown in Figure 1003 (Sheet 1) to counterweight. Place counterweight with sealant to the bottom of the blade root. Sealant cure is waived. Apply Silicone Rubber Sealant P09−014 to the blade lock groove in the blade and the disk. Install the blade and secure with a new blade lock. Apply Silicone Rubber Sealant P09−014 to cover the blade lock bent end.

CAUTION: COUNTERWEIGHTS MUST NOT BE INSTALLED AT LOADING SLOT LOCATIONS. BLADES MAY BE DAMAGED AT THESE LOCATIONS. TOTAL QUANTITY OF COUNTERWEIGHTS ALLOWED INCLUDES QUANTITY USED IN SUBASSEMBLY BALANCING.

(e) Balance correction at Plane AJ (HPC aft end): Correct balance by the installation of counterweights (PN 53H472) to the balance flange on the rear drum in the quantities specified. See Figure 1003 (Sheet 2). Use PWA 87492 Riveter or PWA 100002 Riveter to attach the counterweights to the balance flange with rivets.

(f) If unbalance cannot be corrected to within 0.20 oz−in. (144.0 g.mm), or less in Plane AL and 0.50 oz−in. (360.0 g.mm), or less in Plane AJ by the installation of the maximum quantity of counterweights in Planes AL and AJ, then install counterweights to Plane AF, Stage 13, and measure the balance in Plane AJ again. See Figure 1003 (Sheet 3).

CAUTION: SETSCREW CHANGE LETTER C AND LOCK CHANGE LETTER C AND LOCK AND SETSCREW ASSEMBLY CHANGE LETTER A MUST BE INSTALLED BY LOCKING SETSCREW TO RUNNING TORQUE PLUS 4 − 8 LB−IN. (0.452 − 0.904 N.m).

(10) Blade lock screws must not turn under 10 lb−in. (1.130 N.m) of applied torque. If the screw turns then torque the setscrew to the running torque plus 8 − 12 lb−in. (0.904 − 1.356 N.m).

(11) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−04

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(12) Disconnect the drive unit and remove from the shaft. (Pre SB PW4ENG 72−562) Install PWA 85124 Adapter to the rear shaft and PWA 85161 Adapter to the front hub. (Post SB PW4ENG 72−562) Install the PWA 88700 Adapter to the rear shaft and the PWA 85161 Adapter to the front hub. See Figure 1001.

(13) Install PWA 85086 Arm to HPC front hub. Attach hoist to arm. Install PWA 85086 Arm to rear shaft. Attach hoist to arm. See Figure 1001.

(14) If rotor is to be stored for a period of time, raise rotor from balance machine and lower into PWA 85337 Transport Stand. Remove hoists, arms and adapters. See Figure 1004.

(a) Install PWA 85160 Thread Protector to front hub and PWA 85159 Thread Protector to rear shaft.

(b) Install PWA 85428 Protector on rear shaft airseal.

(15) If rotor is not to be stored, trunnion rotor assembly to front end up position. Remove hoist, arm, and adapter from rear shaft. Lower rotor assembly into PWA 85580 Support Stand with PWA 80515 Stand, PWA 85294 Adapter and PWA 85593 Adapter. Remove hoist, arm, and adapter from front hub. See Figure 1005.

(16) Install the handling fixture to the HPC front hub.

(a) For compressors with the symmetric case, install the PWA 85528 Adapter with the PWA 85537 Fixture to the HPC front hub. See Figure 1006 (Sheet 1).

(b) For compressors with the asymmetric case, install the PWA 85528 Adapter with the PWA 88560 Fixture to the HPC front hub.

(c) Attach the Fixture and Adapter with the PWA 85529 Nut.

(d) Use the PWA 85530 Wrench and PWA 85531 Adapter to torque the Nut to 300 lb−in.(33.895 N.m).

(17) (Pre SB PW4ENG 72−562) Install the PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to the spools of the fixture and raise the rotor from the stand. Install the PWA 85124 Adapter to the rear shaft. Install the PWA 85086 Arm to the adapter and use the hoist to trunnion the rotor to the front end down position. See Figure 1007.

(18) (Post SB PW4ENG 72−562) Install the PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to the spools of the fixture and raise the rotor from the stand. Install the PWA 88700 Adapter to the rear shaft. Install the PWA 85086 Arm to the adapter and use the hoist to trunnion the rotor to the front end down position. See Figure 1007.

(19) Lower rotor assembly onto PWA 87022 Stand. Remove hoist, arm and adapter from rear hub. See Figure 1008.

Figure 1008
(Task 72−35−01−440−006)

Task 72-35-01-440-007:

1. Assemble (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 9th stage bleed air tubes to drum rotor (front) assembly. See 72-35-38, Assembly-13 Task 72-35-38-440-014, Task 72-35-38-440-014-A00 or Task 72-35-38-440-014-B00.

(2) Assemble heatshield, shaft and airseal as required to drum rotor (rear) assembly. See 72-35-39, Assembly-01 Task 72-35-39-440-001, Task 72-35-39-440-001-A00 or Task 72-35-39-440-001-B00.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 12632	Nut
PWA 12633	Ram
PWA 29389	Pump
PWA 29754	Heater Control
PWA 75028	Gage
PWA 76154	Adapter (2 Necessary)
PWA 80513	Rod
PWA 80763	Inserter, Tierod
PWA 85086	Lift Arm (2 Necessary)
PWA 85127	Adapter, Lift And Trunnion
PWA 85129	Support
PWA 85133	Adapter, Lift And Trunnion
PWA 85161	Adapter, Lift
PWA 85162	Adapter, Lift And Trunnion
PWA 85255	Adapter Plate
PWA 85256	Pin, Guide
PWA 85304	Wrench (Optional To PWA 86215)
PWA 85313	Heater (Optional Tools)

Special Tools:

(CONTINUED)

PWA 85314	Heater (Optional Tools)
PWA 85315	Heater (Optional Tools)
PWA 85328	Stand, Storage
PWA 85335	Heater (Optional Tools)
PWA 85426	Protector (Optional)
PWA 85427	Protector (Optional)
PWA 85580	Stand, Support
PWA 85593	Ring, Adapter
PWA 85596	Adapter, Threaded
PWA 86060	Console, Data Acquire
PWA 86061	Test Stand, Calibration
PWA 86215	Wrench System, Torque
.PWA 86062	Assembly, Gearbox
.PWA 86063	Module, Software
.PWA 86064	Assembly, Gearbox
.PWA 86065	Module, Software
.PWA 86066	Adapter, Calibration
.PWA 86067	Module, Software
.PWA 86068	Cabinet, Storage
.PWA 101501	Locator, Bolt
PWA 87775	Holder, Manual
PWA 87800	Tool, Retension
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling

NOTE: The PWA 86215 Wrench System has all the tools indicated below the system.

Consumable Materials:

Item No.	Designation
P03-001	Engine Oil
P06-054	Paste, Antiseize (PWA 36246)

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quick Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: TITANIUM HEATS UP MORE RAPIDLY THAN OTHER MATERIALS. TAKE EXTREME CARE WHEN HEATING TITANIUM PARTS. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

(1) Install PWA 85127 Adapter to the tierod end of the drum rotor (rear) assembly. Use PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to lift the drum rotor from the support.

(2) Assemble PWA 85593 Adapter Ring to PWA 85580 Support Stand. Place stand with ring adapter to set on adapter ring. Secure stand to adapter ring with clamps. Lower drum rotor to rest on ring adapter. Remove hoist, sling, adapters and adapter from drum rotor. See Figure 1001.

(3) Install PWA 85596 Threaded Adapter to drum rotor hub. Secure adapter to hub with clamp details. Install PWA 85427 Protector to rear hub airseal.

(4) Install PWA 85133 Adapter to the front flange of the drum rotor (front) assembly. Use a PWA 88643 Sling or PWA 88673 Sling with the PWA 76154 Adapters to lift the drum rotor (front). See Figure 1002.

(5) Position PWA 85313 Heater with PWA 29754 Control on bench heating element up. Lower drum rotor (front) to rest on heater. Heat drum rotor rear flange to temperature not to exceed 300°F (148.9°C). See Figure 1003.

(6) Install tierods in the front flange of the rear drum with PWA 80763 Tierod Inserter. See Figure 1004.

(7) Apply Antiseise Paste P06-054, to tierod threads on drum rotor (rear). Wipe off unwanted paste.

NOTE: In order to obtain proper prevailing torque, it is necessary to preassemble tierods and nuts prior to final assembly. Use PWA 87775 Manual Holder to lock tierods in place when nuts are run on tierods.

(8) When temperature of drum rotor is achieved, shut off heater and raise drum rotor (front) to position over drum rotor (rear) in assembly stand.

(9) Locate circled triangle denoting high point runout on front and rear drum snaps. Position both 180 degrees apart. Lower drum rotor, aligning tierods with tierod holes, to seat on drum rotor (rear). Remove hoist and sling with adapters.

(10) Install PWA 85255 Adapter Plate to rest on adapter on front flange of drum rotor (front). Install PWA 80513 Rod down through drums and secure to adapter in hub. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to
R ram, apply load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1005.

(11) Remove pump and gage, nut, ram, rod, adapter plate and adapter.

(12) Apply Antiseise Paste P06-054, to contact face of 12th stage tierod nuts. Wipe off unwanted paste.

(13) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 Wrench) with the PWA 86060 Data Acquisition Console and the PWA 86061 Calibration Test Stand to torque the 42 tierod nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system).

NOTE: See manufacturers data for complete use instructions.

(a) Install nuts into wrench and one by one place nuts onto each tierod.

(b) Run nuts down snug.

(14) FOR THESE MODELS: 4152, 4156A, 4158
(Reference 1550) Tighten and torque nuts in following sequence:

(a) FOR THESE MODELS: 4152, 4156A, 4158
Torque tierod nuts in pairs approximately 180 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m) until all nuts have been torqued to 215 − 235 lb−in. (24.292 − 26.551 N.m).

(b) FOR THESE MODELS: 4152, 4156A, 4158
Using same sequence loosen nuts and tighten to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus prevailing torque (torque required to turn nut due to self−locking feature of nut). Prevailing torque is 9.5 − 40 lb−in. (1.073 − 4.519 N.m). Then, apply angle of turn of 74 − 78 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb−in. (79.089 N.m). Remove wrench.

(15) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
(Reference 1560) Tighten and torque nuts in following sequence:

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Torque tierod nuts in pairs approximately 180 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 − 235 lb−in. (24.292 − 26.551 N.m) until all nuts have been torqued to 215 − 235 lb−in. (24.292 − 26.551 N.m).

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Using same sequence loosen nuts and tighten to 20 − 30 lb−in. (2.260 − 3.390 N.m) plus prevailing torque (torque required to turn nut due to self−locking feature of nut). Prevailing torque is 9.5 − 40 lb−in. (1.073 − 4.519 N.m). Then, apply angle of turn of 74 − 78 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb−in. (79.089 N.m). Remove wrench.

(16) Position PWA 85314 Heater, connected to PWA 29754 Control, on bench heating element up.

(17) Install PWA 85161 Adapter to front hub on storage rack. Attach PWA 85086 Arm to adapter. Using hoist attached to arm, raise hub.

(18) Lower hub to rest on heater. Heat rear snap to temperature not to exceed 300°F (148.9°C). See Figure 1006.

(19) When temperature of front hub is achieved, shut off heater and raise front hub to position hub over assembly in assembly stand. Locate circled triangle denoting high point runout on front drum and front hub. Position both 180 degrees apart. Using two PWA 85256 Guide Pin, lower hub to rest on assembly. Remove pins, hoist, arm and adapter from hub.

(20) Install PWA 80513 Rod down through hub and drums and secure to adapter in rear hub. Install PWA 85255 Adapter Plate to rest on front hub tierod flange. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to
R ram, apply load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1007.

(21) Remove pump and gage, nut, ram, rod and adapter plate.

(22) Install PWA 85315 Heater, connected to PWA 29754 Control, on front hub tierod flange. Heat snap to temperature not to exceed 300°F (148.9°C). See Figure 1008.

(23) Install PWA 85162 Adapter to disk blade slots. Using hoist with PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters attached to adapter place disk on PWA 85129 Support, flange end down. Remove sling, hoist and adapter. See Figure 1009.

(24) For engines not incorporating integral inlet airseal and 5th stage disk (Pre SB PW4ENG 72-290), install inlet airseal.

  (a) Install PWA 85335 Heater to rest on Stage 5 disk. Connect PWA 29754 Control and heat snap to temperature not to exceed 300°F (148.9°C). See Figure 1010.

(b) When temperature of disk flange is achieved shut off heater and remove from hub. Install airseal to disk flange aligning bolt holes. Allow area to cool to touch. See Figure 1011.

(c) Install 40 bolts, threads lubricated with Engine Oil P03-001, and nuts. Install bolts, heads up, and tighten and torque nuts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Install PWA 85426 Protector on airseal.

(25) For engines incorporating integral inlet airseal and 5th stage disk (Post SB PW4ENG 72-290), install PWA 85426 Protector on airseal.

(26) Install hoist with PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters on the adapter (installed around blade slots). Raise and trunnion disk so tiebolt flange faces up and lower onto PWA 85328 Storage Stand.

(27) Install 42 tiebolts to flange using PWA 80763 Inserter. See Figure 1012.

(28) Apply Antiseise Paste P06-054, to threads of tierods on 5th stage. Wipe off unwanted paste.

NOTE: In order to obtain proper prevailing torque, it is necessary to preassemble tierods and nuts prior to final assembly. Use PWA 87775 Manual Holder to lock tierods in place when nuts are run on tierods.

(29) When temperature of front hub is achieved, shut off heater and remove from hub. Raise 5th stage assembly and install over hub. Locate circled triangle denoting high point runout on front hub and 5th stage disk. Position both 180 degrees apart. Lower disk aligning tierods with tierod holes. Remove hoist, sling, adapters and adapter from assembly.

(30) Install Rod PWA 80513 down through hub and drums and secure to adapter in rear hub. Install PWA 87800 Retention Tool to rest on 5th stage disk. Install PWA 12633 Ram and secure with PWA 12632 Nut. Using PWA 75028 Gage and PWA 29389 Pump attached to ram, apply
R load of 1448 psi (9983.6 kPa) maximum and allow parts to cool to touch. See Figure 1013.

(31) Remove pump and gage, nut, ram, rod and retention tool.

(32) Apply Antiseise Paste P06-054 , to contact face of 6th stage tierod nuts. Wipe off unwanted paste.

(33) Use the PWA 86215 Torque Wrench System (replaces PWA 85304 Wrench) with the PWA 86060 Data Acquisition Console and the PWA 86061 Calibration Test Stand to torque the 42 tierod nuts that hold the front drum rotor to the rear drum rotor. (See the manufacturers data for complete use instructions of the torque wrench system).

NOTE: See manufacturers data for complete use instructions.

(a) Install nuts into wrench and one by one place nuts onto each tierod.

(b) Run nuts down snug.

(34) (Reference 1550) Tighten and torque nuts in the following sequence.

(a) Torque tierod nuts in pairs approximately 180 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m). Then, in pairs approximately 90 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m). Then, in pairs approximately 45 degrees apart, to 215 - 235 lb-in. (24.292 - 26.551 N.m) until all nuts have been torqued to 215 - 235 lb-in. (24.292 - 26.551 N.m).

(b) Using same sequence loosen nuts and tighten to 20 - 30 lb-in. (2.260 - 3.390 N.m) plus prevailing torque (torque required to turn nut due to self-locking feature of nut). Prevailing torque is 9.5 - 40 lb-in. (1.073 - 4.519 N.m). Then, apply angle of turn of 72 - 76 degrees. Bolt and nut must be replaced if final torque exceeds 700 lb-in. (79.089 N.m). Remove wrench.

E. Postrequisites

(1) Install 15th stage blades in the (debladed) axial compressor rotor assembly. See Assembly-21, CONFIG-1 (Task 72-35-01-440-008) or Assembly-21, CONFIG-2 (Task 72-35-01-440-009).

Task 72-35-01-440-008:

1. Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble (debladed) axial compressor rotor assembly. See Assembly-20 (Task 72-35-01-440-007).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift
PWA 86571	Gage Set

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure

See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used for fitting and may require platform grinding. SB PW4ENG 72-434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 15.This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
15	23.190 inch (589.026 mm)	23.198 inch (589.229 mm)	23.194 inch (589.128 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 15th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. See Figure 1001.

(3) Optional, weigh the 15th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps

are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade, leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just-installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades except one from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C sets to slot and move to right. Remaining blade should be one Type A blade which will be used for fitting. Load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

(a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

(b) Measure platform width of Type A blade, not installed in drum, with vernier caliper. Record this dimension.

(c) Compare the gap dimension with the blade platform width dimension.

(d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove additional Type A blade to obtain proper fit and remove material in approximately equal amounts from both sides of Type A blade platform.

(c) If total amount of material to be removed exceeds 0.080 inch (2.032 mm), remove additional Type A blades as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit. Remove material in equal amounts from both sides of platform on these blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm). Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

(d) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. If the 0.055 inch (1.397 mm) maximum gap limit is not met, interchange these wider platform blades with Type A blades as needed to meet the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(21) If necessary, grind HPC 15th stage blade platforms per 72−35−39, Assembly−03 (Task 72−35−39−440−003). As an alternate to grinding platforms on Type A blades, PN 52H315−04 blades may be used in their place. These blades have platforms which are preground to 0.010 inch (0.254 mm) undersize. Replace one or more Type A blades with the preground blade as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit.

(22) If grinding of blade platforms was required, install Type A blades in slot and check gap. Continue grinding and checking gap until 0.020 − 0.055 inch (0.51 − 1.40 mm) limit is met.

(23) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

(24) Apply Antiseize Compound P06-009 to seals (side opposite flat side) and to drum groove.

(25) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetalic drift and mallet to move blades and seals around drum.

(26) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install reworked Type A blade equally.

(27) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install reworked Type A blades equally spaced.

(28) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(29) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(30) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(31) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(32) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 - 0.030 inch (0.25 - 0.76 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 - 0.055 inch (0.51 - 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly-22, CONFIG-1 (Task 72-35-01-440-010).

Blade And Lock Installation Schematic View
Figure 1006
(Task 72−35−01−440−008)

Task 72−35−01−440−009:

1. Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 86571	Gage Set

B. Measurement of Z−Plane for Stage 15.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z−Plane diameter for Stage 15. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z−Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z−Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z−Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
15	23.190 inch (589.026 mm)	23.198 inch (589.229 mm)	23.194 inch (589.128 mm)

HPC Front Drum Z−Plane Diameters
Table 1001

C. General

(1) Use one of the three procedures that follow to install the 15th stage blades.

R (a) Use (Task 72-35-01-440-009-A) of this procedure to install the 15th stage blades for engines with drum rotor disk assembly (called drum rotor) PN 53H973-01 or 54H803-01 (Pre SB PW4ENG 72-565).

R (b) Use (Task 72-35-01-440-009-B) of this procedure to install the 15th stage blades for engines with (modified) drum rotor disk assembly (called drum rotor) PN 53H973-001 or 54H803-001 (Post SB PW4ENG 72-565), or PN 54H803-002 (Post SB PW4ENG 72-750).

R (c) Use (Task 72-35-01-440-009-C) of this procedure to install the 15th stage blades for engines with drum rotor disk assembly (called drum rotor) PN 56H013-01 (Post SB PW4ENG 72-565), PN 56H013-001 or 58H236-01 (Post SB PW4ENG 72-750).

Task 72-35-01-440-009-A:

2. Assemble 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly For Engines With Drum Rotor PN 53H973-01 Or 54H803-01 (Pre SB PW4ENG 72-565) R

A. Prerequisites

(1) Assemble (debladed) axial compressor rotor assembly. See Assembly-20 (Task 72-35-01-440-007).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure

See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the

majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together. clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C. See Figure 1001.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 15th stage blades from the storage rack and place them on a bench. Segregate four Types B and C blades having notches in their platforms and move them to one side. See Figure 1001.

(2) Optional, weigh the 15th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange Type A blades in two (2) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade (blade No. 62) will be at the bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. These blades will be identified by a square that is marked in the service time marking area.

(4) Divide the Types B and C blades into two (2) sets of four (4) blades (two (2) Type B and two (2) Type C blades make a set) such that weights of the sets are as nearly equal as possible. See Figure 1003.

NOTE: The weights must be nearly equal as these blade sets will be positioned opposite each other after assembly.

(5) Install one of the two Types B and C blade sets (two Types B and C blades make a set), two lock and setscrew assemblies and five Type A blades. See Figure 1002, Figure 1003, Figure 1004 (Sheets 1 and 2), Figure 1005 (Sheets 1 and 2) and Figure 1006.

(a) Find one of two 15th stage loading slots that has locking slots on each side of it.

(b) Select one of the Types B and C blade sets. Install one Type B blade, leading edge up, into the slot. Move the blade to the left and past the locking slot.

(c) Install one lock and setscrew assembly and move it to the left.

(d) Move the lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(e) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(f) Use an approved marking pen to mark the outside diameter platform of the drum, in line with the lock, with a "V" for future reference.

(g) Install a Type C blade and move it to the left until it touches the lock.

(h) Install the remaining Type C blade and move it to the right and past the locking slot.

(i) Insert one lock and setscrew assembly and move it to the right.

NOTE: Do not tighten the lock.

(j) Install the remaining Type B blade from the set into the loading slot and move it to the right.

(k) Install 12 Type A blades to fill the area between the two blade locks.

1 Start with the blades from Column 1. Install blade number 1 and move it fully to the left. Install blades 3, 5, 7 and 9, in sequence, and move them fully to the left.

2 Start with the blades from Column 1. Install blade number 23 and move it to the right sufficiently to permit further installation. Install blades 21, 19, 17, 15, 13 and 11, in sequence.

3 When blades 1 through 23 are installed, move all the blades fully to the left so they all touch.

(6) Rotate the drum 180 degrees. Position the open blade loading slot toward the operator.

(7) Install the remaining Type A blades (numbers 25 through 61) from Column 1, in sequence, and move them to the left so they touch the blades you just installed.

(8) Install the right side blades and lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004 (Sheets 1 and 2), Figure 1005 (Sheets 1 and 2) and Figure 1006.

(a) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade number 62, the lightest blade) and continue up to the top of the column (blade number 2).

(b) Install 19 Type A blades in sequence (numbers 62 through 26). Start with the lightest blade (blade number 62). Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Take a Type C blade from the Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(e) Take a Type B blade from the Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(f) Install the next five Type A blades (numbers 24 through 16) in sequence and move them fully to the right.

(g) Install the remaining Type B blade and move it fully to the left.

(h) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock.

(i) Install the remaining Type C blade and move it fully to the left.

NOTE: Seven Type A blades remain.

(j) Install the next six blades in sequence. Install blade number 2, then 4, 6, 8, 10 and 12. Do not install blade number 14 which will be used for fitting.

(9) Measure the gap dimension. See Figure 1006.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with the PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find the Type A blade (number 14) that will be installed in the gap you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.000 − 0.010 inch (0.00 − 0.25 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(10) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.000 - 0.010 inch (0.00 - 0.25 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.010 inch (0.25 mm). If the 0.010 inch (0.25 mm) maximum gap limit is not met, replace the standard Type A blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.000 - 0.010 inch (0.00 - 0.25 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(11) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.010 inch (0.25 mm). If the 0.010 inch (0.25 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms as needed to meet the 0.000 - 0.010 inch (0.00 - 0.25 mm) limit.

(b) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(c) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(d) If it is necessary to remove material, machine the HPC 15th stage blade platforms per 72−35−39, Assembly−03 (Task 72−35−39−440−003).

(e) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(12) After the gap limits have been met, remove all blades and locks from the right side of the slot and put them in order of removal on the work bench. Remove all blades and locks from the left side of slot and also put them in order of removal on the work bench.

NOTE: Do not remove the Types B and C blades and lock that were first installed (where the V mark was made on the Drum).

(13) Rotate the drum 180 degrees so that the two installed blades and the installed and tightened lock and setscrew assembly are to your left.

(14) Apply Antiseize Compound P06−009 to the blade ladder seals (side opposite flat side) and to the drum groove.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(15) Install the ladder seal and blades, numbers 1 through 9. See Figure 1006.

NOTE: The blades will be installed in the order that they were removed.

(a) Put the appropriate ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the drum.

(c) Install blade number 1, leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the left until the second opening is aligned with the slot.

NOTE: Be sure that the seal is correctly installed between the 15th stage drum rails.

(e) Continue the blade installation instructions above until blades 1 through 9 are installed, moved fully to the left and touch the Type C blade that was installed before.

(f) Install the next Type C blade, a lock, then the next Type B blade. move them to the right to make room for blades, numbers 11 through 23.

NOTE: Do not tighten the lock and setscrew assembly.

(16) Follow the method above to install blades, numbers 23 through 15, and the appropriate ladder seal.

(17) Install blades, numbers 13 and 11, then move all the blades and seals fully to the left until they touch the tightened blade and lock assembly.

(18) Rotate the drum 180 degrees so that the open loading slot is in front of you.

(19) Follow the method given before to install blades, numbers 25 through 61, and the appropriate ladder seal. Move the blades and seal as an assembly fully to the left until they touch the blades that were installed before.

(20) When the blades, locks and seals are fully installed on the left side, install the right side blades, numbers 2 through 62, seals and locks.

(a) Put the appropriate ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install blade number 62, leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the 15th stage drum rails.

(e) Continue the blade installation until blades, numbers 62 through 26, are installed, moved fully to the right and touch the Type C blade that was installed before.

(f) Install the next Type C blade, the lock, then the next Type B blade. Move them fully to the right until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(g) Follow the method given before to install blades, numbers 24 through 16, and the appropriate seal. Move them fully to the right until they touch the blades that were installed before.

(h) Install the remaining Type B blade, lock and the Type C blade. Move them fully to the left until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(i) Follow the method you used before to install blades, numbers 2 through 10, and the appropriate seal. Move them fully to the left until they touch the blades that were installed before.

(j) Install blade number 12. Blade number 14 has not yet been installed.

(k) Loosen the lock and setscrew assembly that is located by the V mark. Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(l) Move the blades, seals and locks to the right, sufficiently to permit the installation of blade number 14. Install blade number 14.

(21) Move all blades, seals and locks to the left. Align the blade lock with the V mark made on the drum at the beginning of this procedure.

(22) Tighten and torque the four lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly-22, CONFIG-2 (Task 72-35-01-440-020).

Task 72-35-01-440-009-B:

3. Assemble 15Th Stage Blades In The (Debladed) Axial Compressor
R Rotor Assembly For Engines With Modified Drum Rotor PN
R 53H973-001 Or 54H803-001 (Post SB PW4ENG 72-565), Or PN
R 54H803-002 (Post SB PW4ENG 72-750)

A. Prerequisites

(1) Assemble (debladed) axial compressor rotor assembly. See Assembly-20 (Task 72-35-01-440-007).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1007,Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A

2. Type B Blades
3. Ladder Seals, PN 54H335, Two Necessary.
4. Type A Blades
5. Ladder Seals, PN 54H334, Four Necessary.
6. Lock And Setscrew Assembly

Key to Figure 1004 (Sheet 1)

modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C. See Figure 1007.

NOTE: For modified HPC drum rotor, PN 54H803-001 or 53H973-001, the original four locking slots are not used. There are now eight (8) lock setscrews at eight (8) new locking slot locations.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 15th stage blades from the storage rack and place them on a bench. Segregate eight Types B and C blades having notches in their platforms and move them to one side. See Figure 1007.

(2) Optional, weigh the 15th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) (Optional) arrange Type A blades in two (2) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade (blade number 54) will be at the bottom of Column 2. See Figure 1008.

NOTE: One or more Type A blade may have been used as a fitting blade. These blades will be identified by a square that is marked in the service time marking area.

(4) Divide the Types B and C blades into four (4) sets of four (4) blades (two (2) Type B and two (2) Type C blades make a set) such that weights of the sets are as nearly equal as possible. See Figure 1009.

NOTE: The weights must be nearly equal as these blade sets will be positioned opposite each other after assembly.

(5) Install one of the four Types B and C blade sets (two Types B and C blades make a set), two lock and setscrew assemblies and Type A blades, numbers 1 and 54. See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

(a) Find one of two 15th stage loading slots that has locking slots on each side of it.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right. Do not tighten the lock.

(d) Install one Type B blade into the slot and move it to the right.

(e) Install the remaining Type B blade into the loading slot and move it to the left.

(f) Inset one lock and setscrew assembly and move it to the left. Do not tighten the lock.

(g) Install the remaining Type C blades and move it to the left.

(h) Install blade number 54 (the lightest Type A blade) and move it to the right.

(i) Install blade number 1 (the heaviest Type A blade) and move it to the left.

(j) Locate the locking slot on the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(k) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

  1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

  2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

    a If these limits are not kept, check the lock for correct assembly in the disk.

(l) Use an approved marking pen to mark the outside diameter platform of the drum, in line with the lock, with a "V" for future reference.

(m) Move the remaining installed blades and locks to the left until they touch the tightened lock.

(n) Move the right lock so it is positioned in the locking slot and tighten. Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(o) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(6) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

(7) Install blades and lock and setscrew assemblies in Arc CV (right side). See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

(a) Find the Type A blades to be installed. Start at the top of Column 1 (blade number 3, the heaviest blade) and continue to the bottom of the column (blade number 53).

(b) Install eight (8) Type A blades in sequence (3 through 17). Start with the heaviest blade (blade number 3). Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(e) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(f) Install nine Type A blades (19 through 35). Start with the heaviest blade in the loading slot and move it to the right until it touches the blade that was installed before.

(g) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(h) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(i) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(j) Install seven Type A blades (37 through 49). Start with the heaviest blade in the loading slot and move it to the right until it touches the blade that was installed before.

(k) Do not install blade numbers 51 and 53 at this time. Blade number 51 will be used as a fitting blade in a later step.

(8) Install blades and lock and setscrew assemblies in Arc CR. See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

(a) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade number 52, the lightest blade) and continue up to the top of the column (blade number 2).

(b) Install eight (8) Type A blades in sequence (52 through 38). Start with the lightest blade (blade number 52). Install it in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock.

(e) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the lock and setscrew assembly.

(f) Install nine Type A blades (36 through 20). Start with the lightest blade in the loading slot and move it to the left until it touches the blade that was installed before.

(g) Start with the heaviest blade and put each blade in the loading slot and move it to the left until it touches the blade that was installed before.

(h) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the blade that was installed before.

(i) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock.

(j) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the lock and setscrew assembly.

(k) Install seven Type A blades (18 through 6). Start with the lightest blade in the loading slot and move it to the left until it touches the blade that was installed before.

(l) Do not install blade numbers 4 and 2 at this time. Blade number 4 will be used as a fitting blade in a later step.

(9) Install a Type B blade from the remaining Types B and C blade set into the loading slot and move it to the left until it touches the blade that was installed before.

(10) Install a lock and setscrew assembly in the loading slot and move it to the left.

(11) Locate the locking slot on the left of the blade loading slot. Move the lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(12) Install a Type C blade from the remaining Types B and C blade set into the loading slot and move it to the right until it touches the blade that was installed before.

(13) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before.

(14) Install the remaining Type B blade in the loading slot and move it to the right until it touches the blade that was installed before.

(15) Install blade number 53 and move it to the right.

(16) Install the remaining Type C blade in the loading slot and move it to the left until it touches the tightened lock assembly.

(17) Install blade number 2 and move it fully to the left.

(18) Move blade number 53 and the Type B blade that is to the right of the loading slot to the left until they touch blade number 2.

(19) Locate the locking slot on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(20) Select two positions that are approximately 90 degrees from the loading slots. These positions will be measured and used to compute the specified gap for each of the two arcs (Arcs CR and CV). See Figure 1010 (Sheets 1 and 2), Figure 1011 and Figure 1012.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with the PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find the Type A blade number 4 that will be installed to fill the measured gap in Arc CV. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Find the Type A blade number 51 which will be installed to fill the measured gap in Arc CR. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(f) Compare the gap dimension with the blade platform width dimension.

(g) The width of the blade platform must measure 0.060 - 0.080 inch (1.52 - 2.03 mm) smaller than the gap measured at the drum loading slot between the blades.

(h) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(21) Do the procedure that follows for both gap positions.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.060 - 0.080 inch (1.52 - 2.03 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.080 inch (2.03 mm). If the 0.080 inch (2.03 mm) maximum gap limit is not met, replace the standard Type A blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.060 - 0.080 inch (1.52 - 2.03 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(22) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade from the arc and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 15th stage blade platforms per 72−35−39, Assembly−03 (Task 72−35−39−440−003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(23) After the gap limits have been met, loosen the lock and setscrew assemblies that were last to be installed. Remove all blades from the right side of the slot and put them in order of removal on the work bench. Remove

all blades from the left side of slot and also put them in order of removal on the work bench.

NOTE: Six blades will stay in the drum. These are the first six blades, (two Types A, B and C blades) and two blade locks installed at the start of this procedure at the V mark.

(24) Apply Antiseize Compound P06−009 to the blade ladder seals (side opposite flat side) and to the drum groove.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(25) Install the appropriate ladder seal and blades 3 through 17. See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

NOTE: The blades are to be installed in the order that they were removed.

(a) Put one ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install blade number 3, leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the 15th stage drum rails.

(e) Continue the blade installation until blades number 17 is installed, moved fully to the right and touches the Type B blade that was installed before.

(f) Install the next Type C blade, the lock, then the next Type B blade. Move them fully to the right until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(26) Use the steps above to complete the installation of the remaining right side blades and locks. Do not install blade number 53 and the last locking blades and lock at this time.

(27) When the blades, locks and ladder seals are fully installed on the right side, install the left side blades, seals and locks by the instructions above except move the blades, seals and locks to the left.

(28) When the steps above are complete, you will have two Type A blades (numbers 2 and 53), two Types B and C blades and two lock and setscrew assemblies that remain on the bench.

(29) Install the remaining blades and locks.

(a) Install the appropriate Type C blade into the drum slot and move it fully to the right.

(b) Install the appropriate Type B blade into the drum slot and move it fully to the left.

(c) Install the appropriate blade lock into the drum slot and move it fully to the right.

(d) Install the appropriate blade lock into the drum slot and move it fully to the left.

(e) Install the remaining Type B blade and move it to the right.

(f) Install the remaining Type C blade and move it to the left.

(g) Blades 2 and 53 can only be inserted into the drum by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws (at the V mark). Move all blades, seals and locks to the right.

(h) Install blades 2 and 53 in the drum.

(30) Move the blades, seals and locks to the final positions.

(a) Move all blades, seals and locks to the left. Align the blade lock with the V mark made on the drum at the beginning of this procedure.

(b) Check all gaps over Arcs CR and CV. All gaps over Arc CR should be approximately equal. All gaps over Arc CV should be approximately equal.

(c) Tighten and torque the four lock and setscrew assemblies that are located at the two loading slots.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(d) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(31) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly-22, CONFIG-2 (Task 72-35-01-440-020).

Task 72-35-01-440-009-C:

4. Assemble 15Th Stage Blades In The (Debladed) Axial Compressor
R Rotor Assembly For Engines With Drum Rotor PN 56H013-01 (Post
R SB PW4ENG 72-565), PN 56H013-001 Or 58H236-01 (Post SB PW4ENG
R 72-750)

A. Prerequisites

(1) Assemble (debladed) axial compressor rotor assembly. See Assembly-20 (Task 72-35-01-440-007).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-21

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017, and Figure 1018.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C. See Figure 1013.

NOTE: For the new HPC drum rotor, PN 56H013-01, there are four (4) correctly located loading slots and eight (8) lock setscrew assemblies at eight (8) correctly located locking slots. There are no unused loading slots or unused locking slots.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 15th stage blades from the storage rack and place them on a bench. Segregate eight Types B and C blades having notches in their platforms and move them to one side. See Figure 1013.

(2) Optional, weigh the 15th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange Type A blades in six (6) columns. Start with the heaviest blade (blade number 1) at the top of Column 1, and proceed from left to right in descending order of weight. The lightest blade (blade number 54) will be at the bottom of Column 6. See Figure 1014.

NOTE: One or more Type A blade may have been used as a fitting blade. These blades will be identified by a square that is marked in the service time marking area.

(4) Divide the Types B and C blades into four (4) sets of four (4) blades (two (2) Type B and two (2) Type C blades make a set) such that weights of the sets are as nearly equal as possible. See Figure 1015.

NOTE: The weights must be nearly equal as these blade sets will be positioned opposite each other after assembly.

(5) Install one of the four Types B and C blade sets (two Types B and C blades make a set), two lock and setscrew assemblies and Type A blades, numbers 1 and 54. See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017 and Figure 1018.

(a) Find one of two 15th stage loading slots that has locking slots on each side of it.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right. Do not tighten the lock.

(d) Install one Type B blade into the slot and move it to the right.

(e) Install the remaining Type B blade into the loading slot and move it to the left.

(f) Inset one lock and setscrew assembly and move it to the left. Do not tighten the lock.

(g) Install the remaining Type C blades and move it to the left.

(h) Locate the locking slot on the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(i) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

  1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

  2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

    a If these limits are not kept, check the lock for correct assembly in the disk.

(j) Use an approved marking pen to mark the outside diameter platform of the drum, in line with the lock, with a "V" for future reference.

(k) Move the Type C blade to the left until it touches the lock.

(l) Move the Type B blade to the left until it touches the Type C blade.

(m) Move the right lock to the left so it is positioned in the locking slot and tighten. Torque the lock setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(n) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(6) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

(7) Install blades and lock and setscrew assemblies in Arc CV (right side). See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017 and Figure 1018.

(a) Find the Type A blades to be installed. Start at the bottom of Column 6 (blade number 54, the lightest blade) and continue up to the top of the column (blade number 6).

(b) Put each blade, start with the lightest blade (blade number 54), in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(e) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(f) Find the Type A blades to be installed. Start at the bottom of Column 4 (blade nuber 52) and continue up to the top of the column (blade number 4).

(g) Put each blade, start with the lightest blade (blade number 52), in the loading slot and move it to the right until it touches the blade that was installed before.

(h) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(i) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(j) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(k) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade number 50) and continue up the column to blade number 8. Do not install blade number 2 (the last blade in Column 2). Blade number 2 will be used as a fitting blade in a later step.

(l) Put each blade, start with the lightest blade (blade number 50), in the loading slot and move it to the right until it touches the blade that was installed before to complete Arc CV.

(8) Install blades and lock and setscrew assemblies in Arc CR. See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017 and Figure 1018.

(a) Find the Type A blades to be installed. Start at the bottom of Column 1 (blade number 1, the heaviest blade) and continue down to the bottom of the column (blade number 49).

(b) Put each blade, start with the heaviest blade (blade number 1), in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock.

(e) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the lock and setscrew assembly.

(f) Find the Type A blades to be installed. Start at the top of Column 3 (blade number 3) and continue down to the bottom of the column (blade number 51).

(g) Put each blade, start with the heaviest blade, Blade number 3), in the loading slot and move it to the left until it touches the blade that was installed before.

(h) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the blade that was installed before.

(i) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock.

(j) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the lock and setscrew assembly.

(k) Find the Type A blades to be installed. Start at the top of Column 5 (blade number 5) and continue down the column to blade number 47. Do not install blade number 53 (the last blade in Column 5) at this time. Blade number 53 will be used as a fitting blade in a later step.

(l) Put each blade, start with with the heaviest blade (blade number 5), in the loading slot and move it to the left until it touches the blade that was installed before to complete Arc CR.

(9) Install a Type B blade from the remaining Types B and C blade set into the loading slot and move it to the left until it touches the blade that was installed before.

(10) Install a lock and setscrew assembly in the loading slot and move it to the left.

(11) Locate the locking slot on the left of the blade loading slot. Move the lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(12) Install a Type C blade from the remaining Types B and C blade set into the loading slot and move it to the right until it touches the blade that was installed before.

(13) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before.

(14) Install the remaining Type B blade in the loading slot and move it to the right until it touches the blade that was installed before.

(15) Install the remaining Type C blade in the loading slot and move it to the left until it touches the tightened lock assembly.

(16) Move the Type B blade that is to the right of the loading slot to the left until it touches the Type C blade.

(17) Locate the locking slot on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(18) Select two positions that are approximately 90 degrees from the loading slots. These positions will be measured and used to compute the specified gap for each of the two arcs (Arcs CR and CV). See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017 and Figure 1018.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with the PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find Type A blade number 2 that will be installed to fill the measured gap in Arc CV. Use a vernier caliper to measure the platform width of this blade. Record this dimension.

(e) Find Type A blade number 53 that will be installed to fill the measured gap in Arc CR. Use a vernier caliper to measure the platform width of this blade. Record this dimension.

(f) Compare the gap dimension with the blade platform width dimension.

(g) The width of the blade platform must measure 0.060 - 0.080 inch (1.52 - 2.03 mm) smaller than the gap measured at the drum loading slot between the blades.

(h) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows for both gap positions.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.060 − 0.080 inch (1.52 − 2.03 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.080 inch (2.03 mm). If the 0.080 inch (2.03 mm) maximum gap limit is not met, replace the standard Type A blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.060 − 0.080 inch (1.52 − 2.03 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade from the arc and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 15th stage blade platforms by 72-35-39, Assembly-03 (Task 72-35-39-440-003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70-11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(21) After the gap limits have been met, loosen the lock and setscrew assemblies that were last to be installed. Remove all blades from the right side of the slot and put them in order of removal on the work bench. Remove all blades from the left side of slot and also put them in order of removal on the work bench.

NOTE: Four blades will stay in the drum. These are the first set of four blades, (two Types B and C blades) and two blade locks installed at the start of this procedure at the V mark.

(22) Apply Antiseize Compound P06-009 to the blade ladder seals (side opposite flat side) and to the drum groove.

(23) Install the appropriate ladder seal and the blades from Column 6, the first locking blade pair and one lock and setscrew assembly, again. See Figure 1013, Figure 1014, Figure 1015, Figure 1016, Figure 1017 and Figure 1018.

NOTE: The blades are to be installed in the order that they were removed.

(a) Put one ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install blade number 54, leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the 15th stage drum rails.

(e) Continue the blade installation until all the blades from Column 6 are installed, moved fully to the right and touches the Type C blade that was installed before.

(f) Install the next Type B blade, the lock, then the next Type C blade. Move them fully to the right until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(24) Use the steps above to complete the installation of the remaining right side blades and locks. Do not install the last locking blades and lock at this time.

(25) When the blades, locks and ladder seals are fully installed on the right side, install the left side blades, seals and locks by the instructions above except move the blades, seals and locks to the left.

(26) When the steps above are complete, you will have two Types B and C blades and two lock and setscrew assemblies that remain on the bench. Install the appropriate Type C blade into the drum slot and move it fully to the right. Install the appropriate Type B blade into the slot and move it fully to the left.

(27) Install the remaining blades and locks.

(a) Install the blade lock and move it fully to the right.

(b) Install the remaining Type B blade into the drum slot and move it fully to the right.

R
R

(c) The last Type C blade and lock can only be inserted into the drum by moving all blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks fully to the right.

(d) Install the last blade lock and setscrew assembly into the drum slot and move it fully to the left.

(e) Install the last Type C blade in the drum.

(28) Move the blades, seals and locks to the final positions.

(a) Move all blades, seals and locks to the left. Align one blade lock with the V mark made on the drum at the beginning of this procedure.

(b) Check all gaps over Arcs CR and CV. All gaps over Arc CR should be approximately equal. All gaps over Arc CV should be approximately equal.

(c) Tighten and torque the four lock and setscrew assemblies that are located at the two loading slots.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(d) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(29) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly−22, CONFIG−2 (Task 72−35−01−440−020).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72-35-01-440-010:

1. Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 15th stage blades to (debladed) axial compressor rotor assembly. See Assembly-21, CONFIG-1 (Task 72-35-01-440-008).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift
PWA 86571	Gage Set

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used for fitting and may require platform grinding. SB PW4ENG 72-434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−22

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z−Plane diameter for Stage 14. This procedure is optional and can only be used for blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z−Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z−Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z−Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
14	23.192 inch (589.077 mm)	23.200 inch (589.280 mm)	23.196 inch (589.178 mm)

HPC Front Drum Z−Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 14th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. See Figure 1001.

(3) Optional, weigh the 14th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps

are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade, leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just−installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades except one from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C sets to slot and move to right. Remaining blade should be one Type A blade which will be used for fitting. Load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

   (a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

   (b) Measure platform width of Type A blade, not installed in drum, with vernier caliper. Record this dimension.

   (c) Compare the gap dimension with the blade platform width dimension.

   (d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

   (e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove additional Type A blade to obtain proper fit and remove material in approximately equal amounts from both sides of Type A blade platform.

(c) If total amount of material to be removed exceeds 0.080 inch (2.032 mm), remove additional Type A blades as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit. Remove material in equal amounts from both sides of platform on these blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm). Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

(d) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. If the 0.055 inch (1.397 mm) maximum gap limit is not met, interchange these wider platform blades with Type A blades as needed to meet the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(21) If necessary, grind HPC 14th stage blade platforms per 72−35−39, Assembly−03 (Task 72−35−39−440−003). As an alternate to grinding platforms on Type A blades, PN 52H614−04 blades may be used in their place. These blades have platforms which are preground to 0.010 inch (0.254 mm) undersize. Replace one or more Type A blades with the preground blade as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit.

(22) If grinding of blade platforms was required, install Type A blades in slot and check gap. Continue grinding and checking gap until 0.020 − 0.055 inch (0.51 − 1.40 mm) limit is met.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−22

(23) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

(24) Apply Antiseize Compound P06−009 to seals (side opposite flat side) and to drum groove.

(25) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetallic drift and mallet to move blades and seals around drum.

(26) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install reworked Type A blade equally.

(27) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install reworked Type A blades equally spaced.

(28) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(29) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(30) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(31) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(32) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on
R the two sides of the drum. Each arc must have a 0.010
R − 0.030 inch (0.25 − 0.76 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 − 0.055 inch (0.51 − 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly−23, CONFIG−1 (Task 72−35−01−440−011).

Blade And Lock Installation Schematic View
Figure 1006
(Task 72−35−01−440−010)

Task 72-35-01-440-020:

1. Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 86571	Gage Set

B. Measurement of Z-Plane for Stage 14.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 14. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
14	23.192 inch (589.077 mm)	23.200 inch (589.280 mm)	23.196 inch (589.178 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

C. General

(1) Use one of the procedures that follow to install the 14th stage blades.

(a) Use Task 2. (Task 72-35-01-440-020-A00) of this procedure to install the 14th stage blades in pre SB PW4ENG 72-565 HPC assemblies.

(b) Use Task 3. (Task 72-35-01-440-020-B00) of this procedure to install the 14th stage blades in post SB PW4ENG 72-565 HPC assemblies.

Task 72-35-01-440-020-A:

2. Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Pre SB PW4ENG 72-565 Only)

A. Prerequisites

(1) Assemble 15th stage blades (debladed) axial compressor rotor assembly. See Assembly-21, CONFIG-2 (Task 72-35-01-440-009).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual (Optional to PWA 88739)
PWA 86448	Drift
PWA 88739	Spreader, Manual

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1001, Figure, 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-22

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove the 14th stage blades from their storage rack and place them on a work bench. Segregate four (4) each of Types B and C blades having notches in their platforms and move the blades to one side. See Figure 1001.

(2) Optional, weigh the 14th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange Type A blades in four (4) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at the bottom of Column 4. See Figure 1002.

NOTE: One or more Type A blade(s) may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(4) Divide the Types B and C blades into two sets of four blades (two (2) Type B and two (2) Type C per set) such that the weights of the sets are as nearly equal as possible. See Figure 1003.

NOTE: The weights must be nearly equal as the sets will be positioned opposite each other after assembly.

(5) Install one Types B and C blade set and two lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

(a) Find one of the two 14th stage blade loading slots.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the loading slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right.

(d) Install one Type B blade into the slot. Move the blade to the right.

(e) Install the remaining Type B blade in the loading slot and move it to the left.

(f) Install one lock and setscrew assembly and move it to the left.

(g) Install the remaining Type C blade and move it to the left.

(h) Locate the locking slot to the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(i) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(j) Use an approved marking pen to mark the OD platform of the drum, in line with the lock, with a "V" for future reference.

(k) Move the Type C blade to the left until it touches the lock.

(l) Move the Type B blade to the left until it touches the Type C blade.

(m) Move the right lock to the left so that it is positioned in the loading slot and tighten. Torque the lock and setscrew assembly to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(n) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(o) Push the two remaining Types B and C blades so they touch the just-installed locks.

(6) Rotate the drum 180 degrees. Position the open blade slot toward the operator.

(7) Install the right side blades and lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

(a) Find the Type A blades to be installed. Start at the bottom of column four (blade number 68) and continue up to the top of the column (blade number 4).

(b) Put each blade, start with blade number 68, in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Continue to install Type A blades, start at the bottom of Column 2 (blade number 66) and continue up to the top of the column (blade number 2).

(d) Put each blade, start with blade number 66, in the loading slot and move it to the right until it touches the blade that was installed before.

(8) Install the left side blades and lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

(a) Find the Type A blades to be installed. Start at the top of Column 3 (blade number 3) and continue down to the bottom of the column (blade number 67).

(b) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Continue to install Type A blades. Start at the bottom of Column 1 (blade number 1) and continue down the column.

(d) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before. Do not install the last blade (blade number 65) at this time.

(9) Install the remaining Types B and C blade set and two lock and setscrew assemblies.

(a) Install a Type C blade into the loading slot. Move the blade to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(c) Install a Type B blade into the slot. Move the blade to the right until it touches the lock and setscrew assembly that was installed before.

(d) Install the remaining Type B blade in the loading slot and move it to the left until it touches the blade that was installed before.

(e) Install the last lock and setscrew assembly and move it to the left until it touches the blade that was installed before. Do not tighten the lock at this time.

(f) Install the remaining Type C blade and move it to the left until it touches the blade that was installed before.

(10) Move the blades tangentially to make the widest possible gap between the last installed Type B blade and the last Type A blade. This gap will be measured and used to compute the specified gap for between the blades.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all the blades tangentially so as to form the widest possible gap in each arc.

(b) Place the spreader into the vacant Type A blade space. Expand the spreader with the torque handle and measure the blade gap between the blade platforms with a vernier caliper. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and record this gap dimension.

(d) Find the Type A blade (blade number 65) that will be installed in the arc you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.000 − 0.010 inch (0.00 − 0.25 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(11) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.000 − 0.010 inch (0.00 − 0.25 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.010 inch (0.25 mm). If the 0.010 inch (0.25 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.000 − 0.010 inch (0.00 − 0.25 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(12) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 14th stage blade platforms per 72−35−39, Assembly−03 (Task 72−35−39−440−003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(13) After the gap limits have been met, remove all blades from the right side of the slot and place them in the order of removal on the work bench. Remove all blades from the left side of the slot and also place them in order of removal on the bench.

NOTE: Four (4) blades and two (2) blade locks are to remain in the disk. These are the first set of four (4) blades (two (2) Type B and two (2)

Type C) and two (2) blade locks installed at the start of this procedure.

(14) Apply Antiseize Compound P06−009 to the blade ladder seals (side opposite flat side) and to the drum groove.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(15) Install the right side ladder seals and blades. See Figure 1006.

NOTE: The blades will be installed in the order that they were removed.

(a) Put one ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the ladder seal with the loading slot in the disk.

(c) Install the blade that was first removed (blade number 68), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Continue the blade installation instructions above until all the right side blades are installed, moved fully to the right and touch the Type C blade that was installed before.

(f) Install a Type B blade, a lock and then the next Type C blade. Move them fully to the right until they touch the blades that were installed before. Do not tighten the lock and setscrew assembly at this time.

(16) When the blades, seals and locks have been fully installed on the right side, install the left side blades, seals and locks by the instructions above except move the blades, seals and locks to the left.

NOTE: The last Type C blade and lock will not be installed during this step.

(17) Install the remaining blades and locks.

(a) The last Type C blade and lock can only be inserted in the drum by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks to the right.

(b) Install the last lock and setscrew assembly in the drum slot and move it to the left.

(c) Install the last Type C blade in the slot.

(18) Move the blades, seals and locks to the final position.

(a) Move all the blades, seals and locks to the left. Align the blade lock with the V mark made on the drum at the start of this procedure.

(b) Tighten and torque the two blade lock and setscrew assemblies that are located at the loading slot near the V mark.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(c) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(d) Check the gaps, make all gaps over Arcs CR and CV approximately equal.

(19) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly−23, CONFIG−2 (Task 72−35−01−440−021).

Key to Figure 1004 (Sheet 1)

Task 72−35−01−440−020−B:

3. Assemble 14Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72−565 Only)

A. Prerequisites

(1) Assemble 15th stage blades (debladed) axial compressor rotor assembly. See Assembly−21, CONFIG−2 (Task 72−35−01−440−009).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual (Optional To PWA 88739)
PWA 86448	Drift
PWA 88739	Spreader, Manual

Consumable Materials:

Item No.	Designation
P06−009	Antiseize Compound (PMC 9523)

C. Procedure

See Figure 1007, Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015

inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove the 14th stage blades from their storage rack and place them on a work bench. Segregate eight (8) each of Types B and C blades having notches in their platforms and move the blades to one side. See Figure 1007.

NOTE: For engines that incorporate SB PW4ENG 72-565, old and new parts are interchangeable in full sets, however it is permissible to mix new and modified blades in the same rotor stage.

(2) Optional, weigh the 14th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange Type A blades in six (6) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at the bottom of Column 6. See Figure 1008.

NOTE: One or more Type A blade(s) may have been used as a fitting blade. These blades will be identified by a square in the service time marking area.

(4) Divide the Types B and C blades into four sets of four blades (two (2) Type B and two (2) Type C per set) such that the weights of the sets are as nearly equal as possible. See Figure 1009.

NOTE: The weights must be nearly equal as the sets will be positioned opposite each other after assembly.

(5) Install one of the four Types B and C blade sets and two lock and setscrew assemblies. See Figure 1008, Figure 1009, Figure 1010,Figure 1011 and Figure 1012.

(a) Find one of the two 14th stage blade loading slots that has locking slots on each side of it.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the loading slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right.

(d) Install one Type B blade into the slot. Move the blade to the right.

(e) Install the remaining Type B blade in the loading slot and move it to the left.

(f) Install one lock and setscrew assembly and move it to the left.

(g) Install the remaining Type C blade and move it to the left.

(h) Locate the locking slot to the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(i) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(j) Use an approved marking pen to mark the OD platform of the drum, in line with the lock, with a "V" for future reference.

(k) Move the Type C blade to the left until it touches the lock.

(l) Move the Type B blade to the left until it touches the Type C blade.

(m) Move the right lock to the left so that it is positioned in the loading slot and tighten. Torque the lock and setscrew assembly to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(n) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(o) Push the two remaining Types B and C blades so they touch the just installed locks.

(6) Rotate the drum 180 degrees. Position the open blade slot toward the operator.

(7) Install the right side blades and lock and setscrew assemblies in Arc CV. See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

(a) Find the Type A blades to be installed. Start at the bottom of column six (blade number 60, the lightest blade) and continue up to the top of the column (blade number 6).

(b) Put each blade, start with the lightest blade, blade number 60, in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(e) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(f) Find the Type A blades to be installed. Start at the bottom of column four (blade number 58) and continue up to the top of the column (blade number 4).

(g) Put each blade, start with the lightest blade, in the loading slot and move it to the right until it touches the blade that was installed before.

(h) Take a Type C blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(i) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(j) Take a Type B blade from the second Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(k) Find the Type A blades to be installed. Start at the bottom of column two (blade number 56) and continue up to the top of the column to blade number 8 (blade number 2 is not installed at this time).

(l) Put each blade, start with the lightest blade, in the loading slot and move it to the right until it touches the blade that was installed before to complete Arc CV.

(8) Install the left side blades and lock and setscrew assemblies in Arc CR. See Figure 1008, Figure 1009, Figure 1010,Figure 1011 and Figure 1012.

(a) Find the Type A blades to be installed. Start at the top of column one (blade number 1, the heaviest blade) and continue down to the bottom of the column (blade number 49).

(b) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the right until it touches the blade that was installed before.

(d) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(e) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the right until it touches the lock and setscrew assembly.

(f) Find the Type A blades to be installed. Start at the top of Column 3 (blade number 3) and continue down to the bottom of the column (blade number 51).

(g) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before.

(h) Take a Type B blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the blade that was installed before.

(i) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(j) Take a Type C blade from the third Types B and C blade set and put it in the loading slot and move it to the left until it touches the lock and setscrew assembly.

(k) Find the Type A blades to be installed. Start at the top of Column 5 (blade number 5) and continue down the column (blade number 53 (blade number 59 is not installed at this time).

(l) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before to complete Arc CR.

(9) Install a Type B blade, from the remaining B and C blade set, in the loading slot and move it to the left until it touches the blade that was installed.

(10) Install a lock and setscrew assembly in the loading slot and move it to the left.

(11) Locate the locking slot on the left of the blade loading slot. Move the lock and setscrew assembly into the left locking slot and tighten. Torque the lock and setscrew assembly to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

  (a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

    1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

    2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

      a If these limits are not kept, check the lock for correct assembly in the disk.

(12) Install the C blade from the remaining Types B and C blade set into the loading slot and move it to the right until it touches the blade that was installed before.

(13) Install a lock and setscrew assembly and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(14) Install the remaining B blade from the Types B and C blade set into the loading slot and move it to the right until it touches the blade that was installed before.

(15) Install the remaining C blade from the Types B and C blade set into the loading slot and move it to the left until it touches the tightened lock and setscrew assembly.

(16) Move the Type B blade that is to the right of the loading slot to the left until it touches the Type C blade.

(17) Locate the locking slot on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the lock and setscrew assembly to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

  (a) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

    1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

    2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

      a If these limits are not kept, check the lock for correct assembly in the disk.

(18) Select two positions that are approximately 90 degree from the loading slots. These positions will be measured and used to compute the specified gap for each of the two arcs (Arcs CR and CV). See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

  NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

  (a) Use a PWA 85595 Spreader to load all the blades tangentially so as to form the widest possible gap in each arc.

(b) Place the spreader into the vacant Type A blade space. Expand the spreader with the torque handle and measure the blade gap between the blade platforms with a vernier caliper. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and record this gap dimension.

(d) Find the Type A blade that will be installed in the arc you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

NOTE: Type A blade number 2 will be used to fill the gap in Arc CV. Blade number 59 will be used to fill the gap in Arc CR.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.030 − 0.050 inch (0.51 − 0.055 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows for both gap positions.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.030 − 0.050 inch (0.76 − 1.27 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in an arc is 0.050 inch (1.27 mm). If the 0.050 inch (1.27 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.030 − 0.050 inch (0.76 − 1.27 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade from the arc and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 14th stage blade platforms per 72−35−39 Assembly−03 (Task 72−35−39−440−003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(21) After the gap limits have been met, loosen the lock and setscrew assemblies that were last to be installed. Remove all blades from the right side of the slot and place them in the order of removal on the work bench. Remove all blades from the left side of the slot and also place them in order of removal on the bench.

NOTE: Four (4) blades and two (2) blade locks are to remain in the disk. These are the first set of four (4) blades (two (2) Type B and two (2) Type C) and two (2) blade locks installed at the start of this procedure.

(22) Apply Antiseize Compound P06−009 to the blade ladder seals (side opposite flat side) and to the drum groove.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(23) Install the ladder seals and blades from Column 6, the first locking blade pair and one lock and setscrew assembly, again. See Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

NOTE: The blades will be installed in the order that they were removed.

(a) Put one ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the ladder seal with the loading slot in the disk.

(c) Install the blade that was first removed (blade number 60), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Continue the blade installation instructions above until all the right side blades from Column 6 are installed, moved fully to the right and touch the Type C blade that was installed before.

(f) Install a Type B blade, a lock and then the next Type C blade. Move them fully to the right until they touch the blades that were installed before. Do not tighten the lock and setscrew assembly at this time.

(24) Use the steps above to complete the installation of the remaining right side blades and locks. Do not install the last locking blades and lock.

(25) When the blades, seals and locks have been fully installed on the right side, install the left side blades, seals and locks by the instructions above except move the blades, seals and locks to the left.

(26) When the steps above are complete, you will have two Types B and C blades and two lock and setscrew assemblies remaining on the work bench. Install the appropriate Type C blade into the drum loading slot and move it fully to the right. Install the appropriate Type B blade into the slot and move it fully to the left.

(27) Install the remaining blades and locks.

(a) Install the blade lock and move it to the right.

(b) Install the remaining Type B blade and move it to the right.

(c) The last Type C blade and lock can only be inserted in the drum by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks to the right.

(d) Install the last lock and setscrew assembly in the drum slot and move it to the left.

(e) Install the last Type C blade in the drum.

(28) Move the blades, seals and locks to the final position.

(a) Move all blades, seals and locks to the left. Align one blade lock with the V mark you made on the drum at the beginning of this procedure.

(b) Check all gaps over Arcs CR and CV. All gaps over Arc CR should be approximately equal. All gaps over Arc CV should be approximately equal.

(c) Tighten and torque the four lock and setscrews assemblies that are located at the two loading slots.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(d) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(29) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly−23, CONFIG−2 (Task 72−35−01−440−021).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72−35−01−440−011:

1. Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly−22, CONFIG−1 (Task 72−35−01−440−010).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift
PWA 86571	Gage Set

Consumable Materials:

Item No.	Designation
P06−009	Antiseize Compound (PMC 9523)

C. Procedure

See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-23

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 13. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
13	23.196 inch (589.178 mm)	23.204 inch (589.382 mm)	23.200 inch (589.280 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 13th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. See Figure 1001.

(3) Optional, weigh the 13th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Type B and two Type C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade, leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just−installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades except one from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C set to slot and move to right. Remaining blade should be one Type A blade which will be used for fitting. Load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

 (a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

 (b) Measure platform width of Type A blade, not installed in drum, with vernier caliper. Record this dimension.

 (c) Compare the gap dimension with the blade platform width dimension.

 (d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

 (e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with the oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.40 mm). If the 0.055 inch (1.40 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platform or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of Type A blade platforms.

(c) Remove additional Type A blades as required to obtain the 0.020 - 0.055 inch (0.51 - 1.40 mm) fit. Remove material in equal amounts from both sides of the platform on these blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm).

(d) If it is necessary to remove material, machine the HPC 13th stage blade platforms per 72-35-39, Assembly-03 (Task 72-35-39-440-003).

(e) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70-11, Standard Practices Manual, PN 585005.

(21) If grinding of blade platforms was required, install Type A blades in slot and check gap. Continue grinding and checking gap until 0.020 - 0.055 inch (0.51 - 1.40 mm) limit is met.

(22) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Type B and two Type C) and two blade locks installed at beginning of this procedure.

(23) Apply Antiseize Compound P06-009 to seals (side opposite flat side) and to drum groove.

(24) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetallic drift and mallet to move blades and seals around drum.

(25) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install reworked Type A blades equally spaced.

(26) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install reworked Type A blades equally spaced.

(27) At this point, four (two Type B and two Type C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(28) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(29) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(30) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

(31) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 − 0.030 inch (0.254 − 0.762 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 − 0.055 inch (0.51 − 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 12th stage blades to (debladed) axial compressor rotor assembly. See CONFIG−1, Assembly−24 (Task 72−35−01−440−012).

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-23

Task 72-35-01-440-021:

1. Assemble 13Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 86571	Gage Set

B. Measurement of Z-Plane for HPC Stage 13.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 13. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tool balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
13	23.196 inch (589.178 mm)	23.204 inch (589.382 mm)	23.200 inch (589.280 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

C. General

(1) Use one of the procedures that follow to install the 13th stage blades.

R (a) Use (Task 72-35-01-440-021-A) of this procedure to
R install the 13th stage blades for engines with
R drum rotor disk assembly (called drum rotor) PN
R 53H973-01 or 54H803-01 (Pre SB PW4ENG 72-565),
R modified drum rotor PN 53H973-001 or 54H803-001
R (Post SB PW4ENG 72-565), or PN 54H803-002 (Post SB
R PW4ENG 72-750).

R (b) Use (Task 72-35-01-440-021-B) of this procedure to
R install the 13th stage blades for engines with
R drum rotor disk assembly (called drum rotor) PN
R 56H013-01 (Post SB PW4ENG 72-565), PN 56H013-001
R Or 58H236-01 (Post SB PW4ENG 72-750)

Task 72-35-01-440-021-A:

2. Assemble 13Th Stage Blades In The (Debladed) Axial Compressor
R Rotor Assembly For Engines With Drum Rotor PN 53H973-01,
R 54H803-01 (Pre SB PW4ENG 72-565), Modified Drum Rotor PN
R 53H973-001 Or 54H803-001 (Post SB PW4ENG 72-565), Or PN
R 54H803-002 (Post SB PW4ENG 72-750)

A. Prerequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly-22, CONFIG-2 (Task 72-35-01-440-020).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the

majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove the 13th stage blades from their storage rack and place them on a work bench. Find the four Types B and C blades having notches in their platforms and move them to one side. See Figure 1001.

(2) Optional, weigh the 13th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange the Type A blades in four columns, start with the heaviest blade at top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at bottom of Column 2 (blade number 70. See Figure 1002.

NOTE: One or more Type A blades may have been used as a fitting blade. These blades will be identified by a square that is marked in the service time marking area.

(4) Divide the Types B and C blades into two sets of four blades (two Types B and C blades per set) such that the weights of sets are as near to equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(5) Install one Types B and C blade set, two Type A blades, and two lock and setscrew assemblies. See Figure 1002 through Figure 1005.

(a) Find one of the two 13th stage loading slots.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to right.

(c) Install one lock and setscrew assembly and move to the right.

(d) Install one Type B blade into the slot and move it to the right.

(e) Install the remaining Type B blade into the loading slot and move it to the left.

(f) Install one lock and setscrew assembly and move it to the left.

(g) Install the remaining Type C blade and move it to the left.

(h) Install the Type A blade from the bottom of Column 4 (blade number 68) and move it to the left.

(i) Install the Type A blade from the top of Column 3 (blade number 3) and move it to the right.

(j) Locate the locking slot on the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(k) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

  1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

  2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

    a If these limits are not kept, check the lock for correct assembly in the disk.

(l) Use an approved marking pen to make a "V" mark on the outside diameter platform of the drum and in line with the lock. This mark will be used for future reference.

(m) Move the Type C blade to the left until it touches the lock.

(n) Move the two Type A blades fully to the left until they touch the Type C blades.

(o) Move the Type B blade to the left until it touches the Type A blade.

(p) Move the right lock and setscrew assembly so that it is positioned in the locking slot and tighten. Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(q) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(r) Push the two remaining Types B and C blades to the left so that they touch the just installed locks.

(6) Rotate the drum 180 degrees.Position the open blade loading slot toward the operator.

(7) Install the right side blades and lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004 (Sheets 1 and 2) and Figure 1005.

(a) Find the Type A blades to be installed. Start at the bottom of Column 4 (blade number 64, blade number 68 is installed) and continue up to the top of the column (blade number 4).

(b) Put each blade, start with blade number 64, in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Find more Type A blades to be installed. Start at the bottom of Column 2 (blade number 70) and continue up the column to blade number 6. Do not install blade number 2 at this time.

(d) Put each blade, start with blade number 70, in the loading slot and move it to the right until it touches the blade that was installed before.

(8) Install the left side blades and lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004 (Sheets 1 and 2) and Figure 1005.

(a) Find the Type A blades to be installed. Start at the top of Column 3 (blade number 7, blade number 3 is installed) and continue down to the bottom of the column (blade number 67).

(b) Put each blade, start with blade number 7 (the heaviest blade), in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Find more Type A blades to be installed. Start at the top of Column 1 (blade number 1) and continue down the column.

(d) Put each blade, start with the heaviest blade, in the loading slot and move it to the left until it touches the blade that was installed before. Do not install the last two blades (blades number 65 and 69) at this time.

NOTE: Blade number 65 will be used as a fitting blade in a step that follows.

(9) Install the remaining Types B and C blade set, two Type A blades, and two lock and setscrew assemblies.

(a) Install a Type C blade and move it to the right until it touches the blade that was installed.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock and setscrew assembly that was installed before.

(d) Install Type A blade number 2 and move it to the right.

(e) Install the last Type B blade and move it to the left until it touches the blade that was installed before.

(f) Install the last lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(g) Install the last Type C blade and move it to the left until it touches the blade that was installed before.

(h) Install Type A blade number 69 and move it to the left.

(10) Move the blades tangentially to make the widest possible gap at the blade number 65 position. This gap will be measured and used to compute the necessary gap between the blades. See Figure 1006.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find the Type A blade (blade number 65) that will be installed in the gap you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.020 - 0.055 inch (0.51 - 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(11) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with the oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(12) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 13th stage blade platforms per 72-35-39 Assembly-03 (Task 72-35-39-440-003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70-11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(13) After the gap limits have been met, remove the blades and one lock from right side of the loading slot and place them in order of removal on the work bench. Remove the blades and one lock from left side of the slot and also place them in order of removal on the work bench.

NOTE: Six blades and two blade locks will stay in the disk. These are the six blades, (two Types A, B and C) and two blade locks that were installed at beginning of this procedure.

(14) Apply Antiseize Compound P06-009 to seals (side opposite flat side) and to drum groove.

(15) Install the right side blades, seals and lock. See Figure 1006.

NOTE: The blades and lock will be installed in the order that they were removed.

(a) Put the ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install the blade that was first removed (blade number 64), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second ladder seal opening is aligned with the loading slot.

NOTE: Make sure that the ladder seal is correctly installed between the disk rails.

(e) Continue with the blade installation instructions above and install the right side blades, seal and lock. Do not install blade number 2. Move all blades to the right until they touch the Type C blade that was installed before. Do not tighten the lock you just installed.

NOTE: Do not install blade number 2 at this time.

(16) When the blades, lock and seal are installed on the right side, install the left side blades, seal and lock by the instructions above except move the blades, seal and lock to the left. Do not install blade number 69 at this time.

(17) Install the remaining blades.

(a) The last two blades can only be installed in the disk by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks to the right.

(b) Rotate the drum 180 degrees again.

(c) Install blade number 2 and move it to the right.

(d) Move the blades and seals more to the right. Then install blade number 69.

(18) Move the blades, seals and locks to the final positions.

(a) Move all blades, seals and locks to the left. Align the blade lock with the "V" mark made on the drum at the start of this procedure.

(b) Tighten and torque the two lock and setscrew assemblies that are located at the loading slot near the "V" mark.

1 Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(c) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(d) Check the gaps, all gaps over Arc BG must be approximately equal.

(19) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 12th stage blades to (debladed) axial compressor rotor assembly. See Assembly-24, CONFIG-2 (Task 72-35-01-440-022).

Task 72-35-01-440-021-B:

3. Assemble 13Th Stage Blades In The (Debladed) Axial Compressor
R Rotor Assembly For Engines With Drum Rotor PN 56H013-01 (Post
R SB PW4ENG 72-565), PN 56H013-001 Or 58H236-01 (Post SB PW4ENG
R 72-750)

A. Prerequisites

(1) Assemble 14th stage blades to (debladed) axial compressor rotor assembly. See Assembly-22, CONFIG-2 (Task 72-35-01-440-020).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader, Manual
PWA 86448	Drift

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure
See Figure 1007, Figure 1008, Figure 1009, Figure 1010, Figure 1011 and Figure 1012.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the

Figure 1004 (Sheet 1)
(Task 72-35-01-440-021-A)

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-23

1. Type B Blades
2. Type C Blades
3. Ladder Seals, PN 54H054, Two Necessary.
4. Type A Blades
5. Lock And Setscrew Assemblies

Key to Figure 1004 (Sheet 1)

majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove the 13th stage blades from their storage rack and place them on a work bench. Find the four Types B and C blades having notches in their platforms and move them to one side. See Figure 1007.

(2) Optional, weigh the 13th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

Gap Measurement And Ladder Seal Installation
Figure 1006
(Task 72−35−01−440−021−A)

(3) Optional, arrange the Type A blades in four columns, start with the heaviest blade at top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at bottom of Column 2 (blade number 70. See Figure 1008.

NOTE: One or more Type A blades may have been used as a fitting blade. These blades will be identified by a square that is marked in the service time marking area.

(4) Divide the Types B and C blades into two sets of four blades (two Types B and C blades per set) such that the weights of sets are as near to equal as possible. See Figure 1009.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(5) Install one Types B and C blade set and two lock and setscrew assemblies. See Figure 1008, Figure 1009, Figure 1010 and Figure 1011.

(a) Find one of the two 13th stage loading slots.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to right.

(c) Install one lock and setscrew assembly and move to right.

(d) Install one Type B blade into the slot and move it to the right.

(e) Install the remaining Type B blade into the loading slot and move it to the left.

(f) Install one lock and setscrew assembly and move it to the left.

(g) Install the remaining Type C blade and move it to the left.

(h) Locate the locking slot on the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(i) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

  1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

  2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

    a If these limits are not kept, check the lock for correct assembly in the disk.

(j) Use an approved marking pen to make a "V" mark on the outside diameter platform of the drum and in line with the lock. This mark will be used for future reference.

(k) Move the Type C blade to the left until it touches the lock.

(l) Move the Type B blade to the left until it touches the Type C blade.

(m) Move the right lock and setscrew assembly to the left so that it is positioned in the locking slot and tighten. Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(n) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(o) Push the two remaining Types B and C blades to the left so that they touch the just installed locks.

(6) Rotate the drum 180 degrees. Position the open blade loading slot toward the operator.

(7) Install the right side blades and lock and setscrew assemblies. See Figure 1008, Figure 1009, Figure 1010 and Figure 1011.

(a) Find the Type A blades to be installed. Start at the bottom of Column 4 (blade number 68) and continue up to the top of the column (blade number 4).

(b) Put each blade, start with blade number 68, in the loading slot and move it to the right until it touches the blade that was installed before.

(c) Find more Type A blades to be installed. Start at the bottom of Column 2 (blade number 70) and continue up the column to blade number 2.

(d) Put each blade, start with blade number 70, in the loading slot and move it to the right until it touches the blade that was installed before.

(8) Install the left side blades and lock and setscrew assemblies. See Figure 1008, Figure 1009, Figure 1010 and Figure 1011.

(a) Find the Type A blades to be installed. Start at the top of Column 3 (blade number 3) and continue down to the bottom of the column (blade number 67).

(b) Put each blade, start with blade number 3 (the heaviest blade), in the loading slot and move it to the left until it touches the blade that was installed before.

(c) Find more Type A blades to be installed. Start at the top of Column 1 (blade number 1) and continue down the column.

(d) Put each blade, start with blade number 1, in the loading slot and move it to the left until it touches the blade that was installed before. Do not install the last blade (blade number 69) at this time.

NOTE: Blade number 69 will be used as a fitting blade in a step that follows.

(9) Install the remaining Types B and C blade set and two lock and setscrew assemblies.

(a) Install a Type C blade and move it to the right until it touches the blade that was installed.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock and setscrew assembly that was installed before.

(d) Install the last Type C blade and move it to the right until it touches the blade that was installed before.

(e) Install the last Type B blade and move it to the left until it touches the blade that was installed before.

(f) Install the last lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(g) Move the last Type B blade to the left until it touches the lock and setscrew assembly that was installed before.

(10) Move the blades tangentially to make the widest possible gap between the last installed Type B blade and the last Type A blade. This gap will be measured and used to compute the necessary gap between the blades. See Figure 1012.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find the Type A blade (blade number 69) that will be installed in the gap you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(11) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(12) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 13th stage blade platforms per 72-35-39 Assembly-03 (Task 72-35-39-440-003).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70-11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(13) After the gap limits have been met, remove the Type A blades from right side of the loading slot and place them in order of removal on the work bench. Remove the Type A blades from left side of the slot and also place them in order of removal on the work bench.

NOTE: Four blades and two blade locks will stay in the disk. These are the four blades, (two Types B and C) and two blade locks that were installed at the start of this procedure.

(14) Apply Antiseize Compound P06-009 to seals (side opposite flat side) and to drum groove.

(15) Install the right side blades and seals. See Figure 1012.

NOTE: The blades and lock will be installed in the order that they were removed.

(a) Put one ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install the blade that was first removed (blade number 68), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second ladder seal opening is aligned with the loading slot.

NOTE: Make sure that the ladder seal is correctly installed between the disk rails.

(e) Continue with the blade installation instructions above until all the right side blades are installed, moved fully to the right and touch the Type C blade that was installed before. Do not tighten the lock you just installed.

(f) Install a Type B blade, a lock and the next Type C blade. Move them fully to the right until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(16) When the blades, locks and seals are fully installed on the right side, install the left side blades, seals and locks by the instructions above except move the blades, seals and locks to the left.

NOTE: The last Type C blade and lock will not be installed at this time.

(17) Install the remaining blade and lock.

(a) The last Type C blade and lock can only be installed in the disk by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks to the right.

(b) Install the last lock and setscrew assembly in the loading slot and move it to the left.

(c) Install the last Type C blade in the drum.

(18) Move the blades, seals and locks to the final positions.

(a) Move all blades, seals and locks to the left. Align the blade lock with the "V" mark made on the drum at the start of this procedure.

(b) Tighten and torque the two lock and setscrew assemblies that are located at the loading slot near the "V" mark.

1 Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(c) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

(d) Check the gaps, all gaps over Arc BG must be approximately equal.

(19) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the lock setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(b) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

a If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−23

(1) Assemble 12th stage blades to (debladed) axial compressor rotor assembly. See Assembly−24, CONFIG−2 (Task 72−35−01−440−022).

Task 72-35-01-440-012:

1. Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly-23, CONFIG-1 (Task 72-35-01-440-011).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06-036	Compound, Antigallant (PWA 36035)
P06-041	Lubricant, Dry Film (PWA 36221)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005, Figure 1006 and Figure 1007.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 12. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum,

maximum and nominal Z−Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
12	23.208 inch (589.483 mm)	23.216 inch (589.686 mm)	23.212 inch (589.585 mm)

HPC Front Drum Z−Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 12th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. See Figure 1001.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

R (3) Optional, weigh the 12th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

R NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

R (4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 4. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

R (5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

R (6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

R (7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004Figure 1004 (Sheet 2).

R (8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

R (9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

R (10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

R (11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

R (12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

R (13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

R (14) Push two remaining Types B and C blades to butt against just−installed locks. See Figure 1004 (Sheet 3).

R (15) Rotate drum 180 degrees. Position open blade slot toward operator.

R (16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

R (17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades from Column 1 are inserted.

R (18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C sets to slot and move to right. Remaining blades should be eight Type A blades. Install seven of the Type A blades in slot and load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

(a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

(b) Measure platform width of the remaining Type A blade, not installed in drum, with vernier caliper. Record this dimension.

(c) Compare the gap dimension with the blade platform width dimension.

(d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material that must be removed is more than 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material that can be removed per platform side must not be more than 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 12th stage blade platforms per 72−35−38, Assembly−02 (Task 72−35−38−440−002).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (21) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

R (22) Apply Antigallant Compound P06−036 or Dry Film Lubricant P06−041 to seals (side opposite flat side) and to drum groove. See Figure 1007.

R (23) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetalic drift and mallet to move blades and seals around drum.

R (24) Install remaining right side blades into seal and drum per schematic view Figure 1006.

R (25) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006.

R (26) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

R (27) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws using PWA 83135 Driver and PWA 83136 Extension. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

R (28) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

R (29) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

R (30) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 - 0.030 inch (0.254 - 0.762 mm) gap, measure both sides at the same time. If the gap is not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. You must keep the 0.020 - 0.055 inch (0.51 - 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 11th stage blades to (debladed) axial compressor rotor assembly. See Assembly-25, CONFIG-1 (Task 72-35-01-440-013).

1. Antigallant Treatment Areas

Antigallant Application Areas
Figure 1007
(Task 72−35−01−440−012)

Task 72-35-01-440-022:

1. Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 101165	Gage Set

B. Measurement of Z-Plane for HPC Stage 12.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 12. This procedure is optional and can only be used where blades have been removed. Select the pair of gages from the PWA 101165 Z-Plane Diameter Gage Set. Install gages 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
12	23.208 inch (589.483 mm)	23.216 inch (589.686 mm)	23.212 inch (589.585 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

C. General

(1) Use one of the procedures that follow to install the 12th stage blades.

(a) Use Task 2. (Task 72-35-01-440-022-A) of this procedure to install the 12th stage blades in Pre SB PW4ENG 72-586 HPC assemblies.

(b) Use Task 3. (Task 72-35-01-440-022-B) of this procedure to install the 12th stage blades in Post SB PW4ENG 72-586 HPC assemblies.

Task 72-35-01-440-022-A:

2. Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Pre SB PW4ENG 72-586 Only)

A. Prerequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly-23, CONFIG-2 (Task 72-35-01-440-021).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86448	Drift

Consumable Materials:

Item No.	Designation
P06-036	Compound, Antigallant (PWA 36035)
P06-041	Lubricant, Dry Film (PWA 36221)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005, Figure 1006 and Figure 1007.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove the 12th stage blades from their storage rack and place them on a work bench. Segregate four (4) each of Types B and C blades having notches in their platforms and move the blades to one side. See Figure 1001.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

R (2) Optional, weigh the 12th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

R NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

R (3) Optional, arrange Type A blades in two (2) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at the bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade(s) may have been used as a fitting blade. These blades are identified by a square that is marked in the service time marking area.

R (4) Divide the Types B and C blades into two sets of four blades (two (2) Types B and C per set) such that the weights of the sets are as nearly equal as possible. See Figure 1003.

NOTE: The weights must be nearly equal as the sets will be positioned opposite each other after assembly.

R (5) Install one Types B and C blade set and two lock and setscrew assemblies. See Figure 1002, Figure 1003, Figure 1004 (Sheets 1 and 2) and Figure 1005.

(a) Find one of the two 12th stage blade loading slots.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the loading slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right.

(d) Install one Type B blade into the slot. Move the blade to the right.

(e) Install the remaining Type B blade in the loading slot and move it to the left.

(f) Install one lock and setscrew assembly and move it to the left.

(g) Install the remaining Type C blade and move it to the left.

(h) Locate the locking slot to the left of the blade loading slot. Move the left lock and setscrew assembly into the left locking slot and tighten. Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

1 Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

_a_ Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

_b_ Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(i) Use an approved marking pen to mark the OD platform of the drum, in line with the lock, with a "V" for future reference.

(j) Move the Type C blade to the left until it touches the lock.

(k) Move the Type B blade to the left until it touches the Type C blade.

(l) Move the right lock to the left so that it is positioned in the loading slot and tighten. Torque the lock and setscrew assembly to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

_1_ Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

_a_ Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

_b_ Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(m) Push the two remaining Types B and C blades so they touch the just−installed locks.

R (6) Rotate the drum 180 degrees. Position the open blade loading slot toward the operator.

R (7) Install the right side Type A blades.

(a) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade number 64) and continue up to the top of the column (blade number 2).

(b) Put each blade, start with blade number 64, in the loading slot and move it to the right until it touches the blade that was installed before.

R (8) Install the left side Type A blades. See Figure 1002 through Figure 1005.

(a) Find the Type A blades to be installed. Start at the top of Column 1 (blade number 1) and continue down to the bottom of the column (blade number 63).

(b) Put each blade, start with the heaviest blade, blade number 1, in the loading slot and move it to the left until it touches the blade that was installed before. Do not install the last blade (blade number 63) at this time.

R (9) Install the remaining Types B and C blade set and two lock and setscrew assemblies.

(a) Install a Type C blade into the loading slot. Move the blade to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(c) Install a Type B blade into the slot. Move the blade to the right until it touches the lock and setscrew assembly that was installed before.

(d) Install the remaining Type B blade in the loading slot and move it to the left until it touches the blade that was installed before.

(e) Install the last lock and setscrew assembly and move it to the left until it touches the blade that was installed before. Do not tighten the lock at this time.

(f) Install the remaining Type C blade and move it to the left until it touches the blade that was installed before.

R (10) Move the blades tangentially to make the widest possible gap between the last installed Type B blade and the last Type A blade. This gap will be measured and used to compute the specified gap for between the blades. See Figure 1006.

NOTE: Put the blades in a radially outward direction to prevent a circumferential serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all the blades tangentially so as to form the widest possible gap in each arc.

(b) Place the spreader into the vacant Type A blade space. Expand the spreader with the torque handle and measure the blade gap between the blade platforms with a vernier caliper. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and record this gap dimension.

(d) Find the Type A blade (blade number 63) that will be installed in the arc you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (11) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (12) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material that must be removed is more than 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material that can be removed per platform side must not be more than 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 12th stage blade platforms per 72−35−38 Assembly−02 (Task 72−35−38−440−002).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (13) After the gap limits have been met, remove all blades from the right side of the slot and place them in the order of removal on the work bench. Remove all blades from the left side of the slot and also place them in order of removal on the bench.

NOTE: Four (4) blades and two (2) blade locks are to remain in the disk. These are the first set of four (4) blades (two (2) Types B and C) and two (2) blade locks installed at the start of this procedure.

R (14) Apply Antigallant Compound P06−036 or Dry Film Lubricant P06−041 to the blade ladder seals (side opposite flat side) and to the drum groove in the areas shown to ease the assembly operation. See Figure 1007.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT

METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (15) Install the right side ladder seal and blades. See Figure 1006.

NOTE: The blades will be installed in the order that they were removed.

(a) Put the ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the ladder seal with the loading slot in the disk.

(c) Install the blade that was first removed (blade number 64), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Continue the blade installation instructions above until all the right side blades are installed, moved fully to the right and touch the Type B blade that was installed before.

(f) Install a Type C blade, a lock and then the next Type B blade. Move them fully to the right until they touch the blades that were installed before. Do not tighten the lock and setscrew assembly at this time.

R (16) When the blades, seals and locks have been fully installed on the right side, install the left side blades, seal and lock by the instructions above except move the blades, seal and lock to the left.

NOTE: The last Type C blade and lock will not be installed during this step.

R (17) Install the remaining blade and lock.

(a) The last Type C blade and lock can only be inserted in the drum by moving all the blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screws. Move all blades, seals and locks to the right.

(b) Install the last lock and setscrew assembly in the drum slot and move it to the left.

(c) Install the last Type C blade in the slot.

R (18) Move the blades, seals and locks to the final position.

(a) Move all the blades, seals and locks to the left. Align the blade lock with the V mark made on the drum at the start of this procedure.

(b) Tighten and torque the two blade lock and setscrew assemblies that are located at the loading slot near the V mark.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

2 Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

a Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

b Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(c) Check the gaps, make the left side and the right side gaps approximately equal.

R (19) Tighten and torque the remaining lock and setscrew assemblies.

(a) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

R (20) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 11th stage blades to (debladed) axial compressor rotor assembly. See Assembly−25, CONFIG−2 (Task 72−35−01−440−023).

Task 72−35−01−440−022−B:

3. Assemble 12Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72−586 Only)

A. Prerequisites

(1) Assemble 13th stage blades to (debladed) axial compressor rotor assembly. See Assembly−23, CONFIG−2 (Task 72−35−01−440−021).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86448	Drift

1. Antigallant Treatment Areas

Antigallant Application Areas
Figure 1007
(Task 72−35−01−440−022−A)

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−24

Consumable Materials:

Item No.	Designation
P06−036	Compound, Antigallant (PWA 36035)
P06−041	Lubricant, Dry Film (PWA 36221)

C. Procedure
See Figure 1008, Figure 1009, Figure 1010, Figure 1011, Figure 1012, Figure 1013 and Figure 1014.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z−Plane diameter for Stage 12. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z−Plane Diameter Gage Set. Select the pair of gages from the PWA 101165 Z−Plane Diameter Gage Set. Install gages 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z−Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z−Plane diameters listed, for reference only, in Table 1002.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
12	23.208 inch (589.483 mm)	23.216 inch (589.686 mm)	23.212 inch (589.585 mm)

HPC Front Drum Z−Plane Diameters
Table 1002

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove the 12th stage blades from their storage rack and place them on a work bench. Segregate four (4)

each of Types B and C blades having notches in their platforms and move the blades to one side. See Figure 1008.

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used to get the correct platform gap and may require platform grinding. A modified Type A blade is also available with a 0.015 inch (0.381 mm) oversized platform width to help you get the correct platform gap. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

R (3) Optional, weigh the 12th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

R NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

R (4) Optional, arrange Type A blades in two (2) columns. Start with the heaviest blade at the top left (Column 1), and proceed from left to right in descending order of weight. Lightest blade will be at the bottom of Column 2. See Figure 1009.

NOTE: One or more Type A blade(s) may have been used as a fitting blade. These blades will be identified by a square in the service time marking area.

R (5) Divide the Types B and C blades into two sets of four blades (two (2) Types B and C per set) such that the weights of the sets are as nearly equal as possible. See Figure 1010.

NOTE: The weights must be nearly equal as the sets will be positioned opposite each other after assembly.

R (6) Install the blades and lock and setscrew assemblies on the right side. See Figure 1009, Figure 1010, Figure 1011 (Sheets 1 and 2) and Figure 1012 (Sheets 1 and 2).

(a) Find one of the two 12th stage blade loading slots.

(b) Select one of the Types B and C blade sets. Install one Type C blade, leading edge up, into the loading slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right.

(d) Locate the locking slot, at Position K, on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

NOTE: There are four locking slots that are not used. These slots are for a new tandem blade lock configuration (Post SB PW4ENG 72-586) to allow the option of a different blade quantity for future aerodynamic design potential. They are located at Position J on the left and right sides of both loading slots.

(e) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(f) Use an approved marking pen to mark the OD platform of the drum, in line with the lock, with a "V" for future reference.

(g) Install one Type B blade into the slot. Move the blade to the right until it touches the lock and setscrew assembly.

(h) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

(i) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade number 64, the lightest blade) and continue up to the top of the column (blade number 2).

(j) Install 10 Type A blades, start with blade number 64, in the loading slot and move each blade to the right until it touches the blade that was installed before.

(k) Install the remaining Type C blade and move it to the right until it touches the last Type A blade.

(l) Insert one lock and setscrew assembly and move it to the right until it touches the Type C blade. Do not tighten the lock at this time.

(m) Install the remaining Type B blade into the loading slot and move it to the right until it touches the lock and setscrew assembly.

(n) Install the 22 remaining Type A blades from Column 2 in the loading slot and move them to the right until each one touches the blade that was installed before.

R (7) Install blades and lock and setscrew assemblies on the left side. See Figure 1009, Figure 1010, Figure 1011 (Sheets 1 and 2) and Figure 1012 (Sheets 1 and 2).

(a) Get a Type C blade from the remaining Types B and C blade set. Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before. Do not tighten the lock at this time.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock.

(d) Find the Type A blades to be installed. Start at the top of Column 1 (blade number 1) and continue down to the bottom of the column (blade number 63).

(e) Install 22 Type A blades, start with blade number 1, in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Ten Type A blades remain that are not to be installed at this time.

(f) Get a Type B blade from the remaining Types B and C blade set. Install it in the loading slot and move it to the left until it touches the blade that was installed before.

(g) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before. Do not tighten the lock at this time.

(h) Install a Type C blade in the loading slot and move it to the left until it touches the lock.

(i) Install, in the order that follows, blade numbers 63, 61, 59, then 57 in the loading slot and move them fully to the right.

(j) Install, in the order that follows, blade numbers 45, 47, 49, 51, then 53 in the loading slot and move them fully to the left. Blade number 55 is not installed at this time.

R (8) Move the blades tangentially to make the widest possible gap between the last installed Type A blades. This gap will be measured and used to compute the specified gap for between the blades. See Figure 1013.

NOTE: Put the blades in a radially outward direction to prevent a circumferentially serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86448 Drift.

(c) Measure and make a record of the gap dimension.

(d) Find the Type A blade (blade number 55) that will be installed in the gap you measured. Use a vernier caliper to measure the platform width of the blade. Record this dimension.

(e) Compare the gap dimension with the blade platform width dimension.

(f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

(g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (9) Do the procedure that follows to get the correct blade platform width for both measured gap positions.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with oversized Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the modified Type A blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (10) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total amount of material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed. If the total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If the total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove an additional Type A blade to obtain the proper fit and remove material in approximately equal amounts from both sides of the Type A blade platforms. Repeat this procedure for additional Type A blades, as necessary, to obtain the correct gap.

(c) If it is necessary to remove material, machine the HPC 12th stage blade platforms per 72−35−38 Assembly−02 (Task 72−35−38−440−002).

(d) Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (11) After the gap limits have been met, remove all blades from the right side of the slot and place them in the order of removal on the work bench. Remove all blades from the left side of the slot and also place them in order of removal on the bench.

NOTE: Two (2) blades and one (1) blade lock are to remain in the disk. These are Types B and C blades and the blade lock that were installed and tightened at the start of this procedure.

R (12) Apply Antigallant Compound P06−036 or Dry Film Lubricant P06−041 to the blade ladder seals (side opposite flat side) and to the drum groove in the areas shown to ease the assembly operation. See Figure 1014.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE THAT FOLLOWS, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (13) Install the right side ladder seals, blades and lock and setscrew assembly. See Figure 1013.

NOTE: The blades will be installed in the order that they were removed.

(a) Put the first ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the ladder seal with the loading slot in the disk.

(c) Install the blade that was last removed from the right side (blade number 64), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Install the next three Type A blades to complete assembly of the first ladder seal. Move this blade and seal assembly fully to the right until it touches the Type B blade that is installed.

(f) Install the next two Type A blades and move them fully to the right until they touch the blade and seal assembly that was installed.

(g) Put the second ladder seal over the loading slot with the flat surface out.

(h) Install the next four Type A blades in the ladder seal by the method used above and move the assembly fully to the right until it touches the last Type A blade that was installed.

(i) Install a Type C blade, a lock then the next Type B blade. Move them fully to the right until they touch the blades that were installed before. Do not tighten the lock and setscrew assembly at this time.

(j) Put the third ladder seal over the loading slot with the flat surface out.

(k) Install the remaining 22 Type A blades, from Column 2, in the ladder seal by the method used for the first seal and move the assembly fully to the right until it touches the Type B blade that was installed.

R (14) Install partial left side seals, blades and a lock and a setscrew assembly.

NOTE: The blades will be installed in the order that they were removed.

(a) Put the first ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the ladder seal with the loading slot in the disk.

(c) Install the blade that was last removed (blade number 1), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the left until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Install the next 21 Type A blades to complete assembly of the first ladder seal. Move this blade and seal assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Ten Type A blades remain that are not installed at this time.

(f) Install a Type B blade and a lock and then the next Type C blade. Move them fully to the left until they touch the blade and seal assembly that was installed before. Do not tighten the lock and setscrew assembly at this time.

(g) Put the second ladder seal over the loading slot with the flat surface out.

(h) Install the next four Type A blades in the ladder seal by the method used for the first seal and move the assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Six Type A blades, one Type B blade, one Type C blade and one lock assembly remain.

R (15) Install the remaining blades and lock and setscrew assembly.

(a) Install the remaining Type C blade and move it fully to the right until it touches the blade that was installed before.

(b) Install the last lock and setscrew assembly in the drum slot and move it to the left. Do not tighten the lock at this time.

(c) Install the remaining Type B blade and move it fully to the right until it touches the blade that was installed before.

(d) Put the ladder seal over the loading slot with the flat surface out.

(e) Align the first opening in the ladder seal with the loading slot in the disk.

(f) Install, in the order that follows, blade numbers 63, 61, 59, then 57 through the seal opening and into the loading slot and move them fully to the right.

NOTE: Two Type A blades have not been installed at this time.

(g) The last Type A blades can only be inserted in the drum by moving all blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screw.

(h) Rotate the drum 180 degrees again to the opposite loading slot.

(i) Move all blades, seals and locks to the right, as necessary, to install blades Nos. 55 and 53.

R (16) Move the blades, seals and locks to the final positions.

(a) Move all the blades, seals and locks to the left. Align the blade lock with the V mark made on the drum at the start of this procedure.

(b) Position, tighten and torque the blade lock and setscrew assembly that is located at the loading slot near the V mark.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

R (17) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

1 If these limits are not kept, check the lock for correct assembly in the disk.

R (18) Position, tighten and torque the remaining lock and setscrew assemblies.

(a) Check the gaps, make the left side and the right side gaps approximately equal. All gaps between the ladder seals should be approximately equal.

(b) Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(c) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure height clearance between blade lock and top of blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

D. Postrequisites

(1) Assemble 11th stage blades to (debladed) axial compressor rotor assembly. See Assembly−25, CONFIG−2 (Task 72−35−01−440−023).

Figure 1014
(Task 72−35−01−440−022−B)

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−25

Task 72−35−01−440−013:

1. Assemble 11Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 12th stage blades to (debladed) axial compressor rotor assembly. See Assembly−24, CONFIG−1 (Task 72−35−01−440−012).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06−036	Compound, Antigallant (PWA 36035)
P06−041	Lubricant, Dry Film (PWA 36221)

C. Procedure

See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are four part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type D is used for fitting and may require platform grinding. SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. For ease of assembly, blades in this procedure will be referred to as Types A, B, C and D.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-25

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 11. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
11	23.226 inch (589.940 mm)	23.234 inch (590.144 mm)	23.230 inch (590.042 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 11th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. Also locate eight Type D blade and move to one side. See Figure 1001.

(3) Optional, weigh the 11th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 4. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade, leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just-installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C sets to slot and move to right. Remaining blades should be eight Type D blades which will be used for fitting. Install seven of the Type D blade in slot and load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

  (a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

  (b) Measure platform width of Type D blade, not installed in drum, vernier caliper. Record this dimension.

  (c) Compare the gap dimension with the blade platform width dimension.

  (d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

  (e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type D blades with oversized blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type D blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If the blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type D blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type D blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove additional Type D blade to obtain proper fit and remove material in approximately equal amounts from both sides of Type D blade platform.

(c) If total amount of material to be removed exceeds 0.080 inch (2.032 mm), remove additional Type A blades in addition to Type D blades as required to obtain the 0.020 − 0.055 inch (0.51 − 1.397 mm) fit. Remove material in equal amounts from both sides of platform on these Types D and A blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm). Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See Chapter 70−11, Standard Practices Manual, PN 585005.

(d) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. If the 0.055 inch (1.397 mm) maximum gap limit is not met, interchange these wider platform blades with Type A blades as needed to meet the 0.020 − 0.055 inch (0.51 − 1.397 mm) limit.

(21) If necessary, grind HPC 11th stage blade platforms per 72−35−38, Assembly−02 (Task 72−35−38−440−002). As an alternate to grinding platforms on Type A and/or Type D blades, PN 53H111 blades may be used in their place. These blades have platforms which are preground to 0.010 inch (0.254 mm) undersize. Replace one or more Type A and/or Type D blades with the preground blade as required to obtain the 0.020 − 0.055 inch (0.51 − 1.397 mm) fit.

(22) If grinding of blade platforms was required, install Type D blade in slot and check gap. Continue grinding and checking gap until 0.020 − 0.055 inch (0.51 − 1.397 mm) limit is met.

(23) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

(24) Apply Antigallant Compound P06-036 or Dry Film Lubricant P06-041 to seals (side opposite flat side) and to drum groove.

(25) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetallic drift and mallet to move blades and seals around drum.

(26) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install four Type D blade equally spaced as per figure.

(27) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install four Type D blades equally spaced as per figure.

(28) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(29) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(30) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(31) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(32) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 − 0.030 inch (0.254 − 0.762 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 − 0.055 inch (0.51 − 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 10th stage blades to (debladed) axial compressor rotor assembly. See Assembly−26, CONFIG−1 Task 72−35−01−440−014).

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−25

Task 72−35−01−440−023:

1. Assemble 11Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 12th stage blades to (debladed) axial compressor rotor assembly. See Assembly−24, CONFIG−2 (Task 72−35−01−440−022).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06−036	Compound, Antigallant (PWA 36035)
P06−041	Lubricant, Dry Film (PWA 36221)

C. Measurement of Z−Plane for HPC Stage 11.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z−Plane diameter for Stage 11. This procedure is optional and can only be used where blades have been removed. Select the pair of gages from the PWA 86571 Z−Plane Diameter Gage Set. Install gages 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z−Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z−Plane diameters listed, for reference only, in Table 1001.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−25

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
11	23.226 inch (589.940 mm)	23.234 inch (590.144 mm)	23.230 inch (590.042 mm)

HPC Front Drum Z−Plane Diameters
Table 1001

D. Procedure

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is used for fitting and may require platform grinding. For ease of assembly, blades in this procedure will be referred to as Types A, B and C. See Figure 1001. R

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 11th stage blades from storage rack and place them on bench. Segregate four each of Type B and Type C blades having notches in their platforms and move to one side. See Figure 1001. R R

(2) Optional, weigh the 11th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange Type A blade in two columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(4) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(5) Install blades and lock and setscrew assemblies on the right side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

(a) Find one of two 11th stage loading slots.

(b) Select one of the Type B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to the right.

(c) Install one lock and setscrew assembly and move it to the right.

(d) Locate the locking slot, at Position K, on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews. See Figure 1004.

NOTE: There are four slots that are not used. They are located at, Positions J, on the left and right sides of both loading slots.

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−25

R (e) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

R 1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

R 2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R 3 If these limits are not kept, check the lock for correct assembly in the disk.

R (f) Use an approved marking pen to make a V mark on the outside diameter platform of the drum and in line with the lock. This mark will be used for future reference.

R (g) Install one Type B blade into slot and move it to the right until it touches the lock and setscrew assembly.

R (h) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

R (i) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade Number 60) and continue up to the top of the column (blade Number 2).

R (j) Install 12 Type A blades, start with blade Number 60, in the loading slot and move each blade to the right until it touches the blade that was installed before.

R (k) Install the remaining Type C blade and move it to the right until it touches the last Type A blade.

R (l) Insert one lock and setscrew assembly and move it to the right until it touches the Type C blade.

R NOTE: Do not tighten the lock.

(m) Install the remaining Type B blade into the loading slot and move it to the right until it touches the lock and setscrew assembly.

(n) Install the 18 remaining Type A blades from Column 2 in the loading slot and move them to the right until each one touches the blade that was installed before.

(6) Install blades and lock and setscrew assemblies on the left side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

(a) Get a Type C blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before.

NOTE: Do not tighten the lock.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock.

(d) Find the Type A blades to be installed. Start at the top of Column 1 (blade Number 1) and continue down to the bottom of the column (blade Number 59).

(e) Install 18 Type A blades, start with blade Number 1, in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Twelve Type A blades remain that are not installed.

(f) Get a Type B blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the left until it touches the blade that was installed before.

(g) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Do not tighten the lock.

(h) Install a Type C blade in the loading slot and move it to the left until it touches the lock.

(i) Install, in the order that follows, blade Numbers 59, 57, 55, 53, then Number 51 in the loading slot and move them fully to the right.

(j) Install, in the order that follows, blade Numbers 37, 39, 41, 43, 45, then Number 47 in the loading slot and move them fully to the left.

NOTE: Blade Number 49 is not installed.

(7) Move the blades tangentially to make the widest possible gap between the last installed Type A blades. This gap will be measured and used to compute the specified gap for between the blades.

NOTE: Put the blades in a radially outward direction to prevent a circumferentially serpentine shape to the blades.

(a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

(b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86447 or PWA 86652 Drift.

(c) Measure and record the gap dimension.

(d) Find the last blade to be installed. Measure and record the width of the blade platform using a vernier caliper.

(e) Compare the gap dimension with the blade platform width.

(f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap dimension.

R (g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (8) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (9) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

R (a) If blade platform width is larger than the gap, determine the difference.

R (b) If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed.

R (c) If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. The maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

R (d) If total amount of material to be removed is more than 0.010 inch (0.254 mm), remove additional Type A blades to get the proper fit and remove material in approximately equal amounts from both sides of Type A blade platforms.

R (e) If total amount of material to be removed is more than 0.080 inch (2.032 mm) do as follows:

R 1 Remove additional Type A blades as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) fit.

R 2 Remove material in equal amounts from both sides of platform on these Types A blades.

R 3 The maximum material removal for each platform side must not be more than 0.005 inch (0.127 mm).

R (f) Type A blades with trimmed platforms must be identified with a square symbol in their
R respective service time marking areas. Refer to
R Standard Practices Manual, PN 585005, Section
R 70-11-00 for approved marking pens.

R (g) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm).

R (10) If necessary, grind the HPC 11th stage blade platforms by 72-35-38 Assembly-02 (Task 72-35-38-440-002).

R (11) If grinding of blade platforms was required, install Type A blade in slot and check gap. Continue grinding and checking gap until 0.020 - 0.055 inch (0.51 - 1.397 mm) limit is met.

R CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86447 OR PWA 86652 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (12) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

R NOTE: Two blades and one blade lock are to remain in disk. These are the Type B and Type C blades and the blade lock that were installed and tightened at start of this procedure.

R (13) Apply Antigallant Compound P06-036 or Dry Film Lubricant P06-041 to ladder seals (side opposite flat side) and to drum groove in the area shown to ease the assembly operation. See Figure 1007.

R (14) Install the right side ladder seals, blades and lock and setscrew assemblies. See Figure 1006.

R NOTE: The blades will be installed in the order that they were removed.

R (a) Put the first ladder seal over the loading slot with the flat surface out.

R (b) Align the first opening in the ladder seal with the loading slot in the disk.

R (c) Install the blade that was last removed from the right side (blade Number 60), leading edge up, through the ladder seal and into the loading slot.

R (d) Move the blade and ladder seal to the right until the second opening is aligned with the loading slot.

R NOTE: Be sure that the ladder seal is correctly installed between the disk rails.

R (e) Install the next four Type A blades to complete the assembly of the first ladder seal. Move this blade and ladder seal assembly fully to the right until it touches the Type B blade that is installed.

R (f) Install the next two Type A blades and move them fully to the right until they touch the blade and ladder seal assembly that was installed.

R (g) Put the second ladder seal over the loading slot with the flat surface out.

R (h) Install the next five Type A blades in the ladder seal by the method used above and move the assembly fully to the right until it touches the last Type A blade that is installed.

R (i) Install a Type C blade, a lock and setscrew assembly, then the next Type B blade. Move them fully to the right until they touch the blades that were installed before.

R NOTE: Do not tighten the lock and setscrew assembly.

R (j) Put the third ladder seal over the loading slot with the flat surface out.

R (k) Install the remaining 18 Type A blades, from Column 2, in the ladder seal by the method used for the first ladder seal and move the assembly fully to the right until it touches the Type B blade that is installed.

R (15) Install partial left side ladder seals, blades and a lock and setscrew assembly. See Figure 1006.

R NOTE: The blades will be installed in the order that they were removed.

R (a) Put the first ladder seal over the loading slot with the flat surface out.

R (b) Align the first opening in the ladder seal with the loading slot in the disk.

R (c) Install the blade that was last removed (blade Number 1), leading edge up, through the ladder seal and into the loading slot.

(d) Move the blade and ladder seal to the left until the second opening is aligned with the loading slot.

NOTE: Be sure that the ladder seal is correctly installed between the disk rails.

(e) Install the next 17 Type A blades to complete the assembly of the first ladder seal. Move this assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Twelve Type A blades remain that are not installed.

(f) Install a Type B blade, a lock and setscrew assembly, then the next Type C blade. Move them fully to the left until they touch the blade and ladder seal assembly that was installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(g) Put the second ladder seal over the loading slot with the flat surface out.

(h) Install the next five Type A blades in the ladder seal by the method used for the first ladder seal and move the assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Seven Type A blades, one Type B blade, one Type C blade and one lock assembly remain.

(16) Install the remaining blades and lock and setscrew assembly.

(a) Install the remaining Type C blade and move it fully to the right until it touches the blade that was installed before.

(b) Install the last lock and setscrew assembly in the drum slot and move it to the left.

NOTE: Do not tighten the lock.

(c) Install the remaining Type B blade and move it fully to the right until it touches the blade that was installed before.

(d) Put the ladder seal over the loading slot with the flat surface out.

(e) Align the first opening in the ladder seal with the loading slot in the disk.

(f) Install, in the order that follows, blade Numbers 59, 57, 55, 53, then Number 51 through the ladder seal opening and into the loading slot. Move the assembly fully to the right.

NOTE: Two Type A blades have not been installed.

(g) The last Type A blades can only be inserted in the drum by moving all blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screw.

(h) Rotate the drum 180 degrees again to the opposite loading slot.

(i) Move all blades, ladder seals and locks to the right, as necessary to install blade Number 49 then Number 47.

(17) Move the blades, ladder seals and locks to the final positions.

(a) Move all blades, ladder seals and locks to the left. Align the blade lock with the V mark you made on the drum at beginning of this procedure.

(b) Position, tighten and torque the lock and setscrew assembly that is located at the locking slot near the V mark.

1 Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(18) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow: See Figure 1004 (Sheet 1).

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

R (b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R (c) If these limits are not kept, check the lock for correct assembly in the disk.

R (19) Position, tighten and torque the remaining lock and setscrew assemblies.

R (a) Check the gaps, all gaps between the ladder seals should be approximately equal.

R (b) Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

R (20) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow: See Figure 1004 (Sheet 1).

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1005. R

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R (c) If these limits are not kept, check the lock for correct assembly in the disk.

E. Postrequisites

(1) Assemble 10th stage blades to (debladed) axial compressor rotor assembly. See Assembly-26, CONFIG-2 (Task 72-35-01-440-024).

R Antigallant Application Areas
R Figure 1007
R (Task 72-35-01-440-023)

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-26

Task 72-35-01-440-014:

1. Assemble 10Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 11th stage blades to (debladed) axial compressor rotor assembly. See Assembly-25, CONFIG-1 (Task 72-35-01-440-013).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06-036	Compound, Antigallant (PWA 36035)
P06-041	Lubricant, Dry Film (PWA 36221)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are four part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type D is used for fitting and may require platform grinding. SB PW4ENG 72-434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. For ease of assembly, blades in this procedure will be referred to as Types A, B, C and D.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-26

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 10. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
10	23.112 inch (587.045 mm)	23.120 inch (587.248 mm)	23.116 inch (587.146 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 10th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. Also locate eight Type D blade and move to one side. See Figure 1001.

(3) Optional, weigh the 10th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blade in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade, leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just−installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blade, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from Types B and C sets to slot and move to right. Remaining blades should be eight Type D blade which will be used for fitting. Install seven of the Type D blades in slot and load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

   (a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.

   (b) Measure platform width of Type D blade, not installed in drum, with vernier caliper. Record this dimension.

   (c) Compare the gap dimension with the blade platform width dimension.

   (d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.

   (e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type D blades with oversized blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 − 0.055 inch (0.51 − 1.40 mm).

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type D blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type D blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type D blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove additional Type D blade to obtain proper fit and remove material in approximately equal amounts from both sides of Type D blade platform.

(c) If total amount of material to be removed exceeds 0.080 inch (2.032 mm), remove additional Type A blades in addition to Type D blades as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit. Remove material in equal amounts from both sides of platform on these Types D and A blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm). Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70−11, Standard Practices Manual, PN 585005.

(d) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. If the 0.055 inch (1.397 mm) maximum gap limit is not met, interchange these wider platform blades with Type A blades as needed to meet the 0.020 − 0.055 inch (0.51 − 1.40 mm) limit.

(21) If necessary, grind HPC 10th stage blade platforms per 72−35−38, Assembly−02 (Task 72−35−38−440−002). As an alternate to grinding platforms on Type A and/or Type D blades, PN 52H410 blades may be used in their place. These blades have platforms which are preground to 0.010 inch (0.254 mm) undersize. Replace one or more Type A and/or Type D blades with the preground blade as required to obtain the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit.

(22) If grinding of blade platforms was required, install Type D blade in slot and check gap. Continue grinding and checking gap until 0.020 − 0.055 inch (0.51 − 1.40 mm) limit is met.

(23) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

(24) Apply Antigallant Compound P06−036 or Dry Film Lubricant P06−041 to seals (side opposite flat side) and to drum groove.

(25) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetallic drift and mallet to move blades and seals around drum.

(26) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install four Type D blades equally spaced as per figure.

(27) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install four Type D blade equally spaced as per figure.

(28) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(29) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(30) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(31) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(32) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 − 0.030 inch (0.254 − 0.762 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 − 0.055 inch (0.51 − 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 9th stage blades to (debladed) axial compressor rotor assembly. See Assembly−27, CONFIG−1 (Task 72−35−01−440−015).

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-26

Task 72-35-01-440-024:

1. Assemble 10Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 11th stage blades to (debladed) axial compressor rotor assembly. See Assembly-25, CONFIG-2 (Task 72-35-01-440-023).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06-036	Compound, Antigallant (PWA 36035)
P06-041	Lubricant, Dry Film (PWA 36221)

C. Measurement of Z-Plane for HPC Stage 10.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 10. This procedure is optional and can only be used where blades have been removed. Select the pair of gages from the PWA 86571 Z-Plane Diameter Gage Set. Install gages 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

R
R

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-26

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
10	23.112 inch (587.045 mm)	23.120 inch (587.248 mm)	23.116 inch (587.146 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

D. Procedure

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is used for fitting and may require platform grinding. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 10th stage blades from storage rack and place them on bench. Segregate four each of Types B and C blades having notches in their platforms and move to one side. See Figure 1001. R

(2) Optional, weigh the 10th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

R (3) Optional, arrange Type A blade in two columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(4) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

R (5) Install blades and lock and setscrew assemblies on the right side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

R (a) Find one of two 10th stage loading slots.

R (b) Select one of the Type B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to the right.

R (c) Install one lock and setscrew assembly and move it to the right.

R (d) Locate the locking slot, at Position K, on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

R NOTE: There are four locking slots that are not used. They are located at, Positions J, on the left and right sides of both loading slots.

(e) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

  1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

  2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

  3 If these limits are not kept, check the lock for correct assembly in the disk.

(f) Use an approved marking pen to make a V mark on the outside diameter platform of the drum and in line with the lock. This mark will be used for future reference.

(g) Install one Type B blade into slot and move it to the right until it touches the lock and setscrew assembly.

(h) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

(i) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade Number 54) and continue up to the top of the column (blade Number 2).

(j) Install 8 Type A blades, start with blade Number 54, in the loading slot and move each blade to the right until it touches the blade that was installed before.

(k) Install the remaining Type C blade and move it to the right until it touches the last Type A blade.

(l) Insert one lock and setscrew assembly and move it to the right until it touches the Type C blade.

NOTE: Do not tighten the lock.

(m) Install the remaining Type B blade into the loading slot and move it to the right until it touches the lock and setscrew assembly.

(n) Install the 19 remaining Type A blades from Column 2 in the loading slot and move them to the right until each one touches the blade that was installed before.

(6) Install blades and lock and setscrew assemblies on the left side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005, and Figure 1006.

(a) Get a Type C blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before.

NOTE: Do not tighten the lock.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock.

(d) Find the Type A blades to be installed. Start at the top of Column 1 (blade Number 1) and continue down to the bottom of the column (blade Number 53).

(e) Install 19 Type A blades, start with blade Number 1, in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Ten Type A blades remain that are not installed.

(f) Get a Type B blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the left until it touches the blade that was installed before.

R (g) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before.

R NOTE: Do not tighten the lock.

R (h) Install a Type C blade in the loading slot and move it to the left until it touches the lock.

R (i) Install, in the order that follows, blade Numbers 53, 51, 49, then Number 47 in the loading slot and move them fully to the right.

R (j) Install, in the order that follows, blade Numbers 39, 41, then Number 43 in the loading slot and move them fully to the left.

R NOTE: Blade Number 45 is not installed.

R (7) Move the blades tangentially to make the widest possible gap between the last installed Type A blades. This gap will be measured and used to compute the specified gap for between the blades.

R NOTE: Put the blades in a radially outward direction to prevent a circumferentially serpentine shape to the blades.

R (a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

R (b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86447 or PWA 86652 Drift.

R (c) Measure and record the gap dimension.

R (d) Find the last blade to be installed. Measure and record the width of the blade platform using a vernier caliper.

R (e) Compare the gap dimension with the blade platform width.

R (f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap dimension.

R (g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (8) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades with Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type A blades with the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (9) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

R (a) If blade platform width is larger than the gap, determine the difference.

R (b) If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed.

R (c) If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. The maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

R (d) If total amount of material to be removed is more than 0.010 inch (0.254 mm), remove additional Type A blades to get the proper fit and remove material in approximately equal amounts from both sides of Type A blade platforms.

R (e) If total amount of material to be removed is more than 0.080 inch (2.032 mm) do as follows:

R 1 Remove additional Type A blades as necessary to get the 0.020 − 0.055 inch (0.51 − 1.40 mm) fit.

R 2 Remove material in equal amounts from both sides of platform on these Types A blades.

R 3 The maximum material removal for each platform side must not be more than 0.005 inch (0.127 mm).

R (f) Type A blades with trimmed platforms must be identified with a square symbol in their
R respective service time marking areas. Refer to
R Standard Practices Manual, PN 585005, Section
R 70−11−00 for approved marking pens.

R (g) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm).

R (10) If necessary, grind HPC 10th stage blade platforms per 72−35−38 Assembly−02 (Task 72−35−38−440−002).

R (11) If grinding of blade platforms was required, install Type A blades in slot and check gap. Continue grinding and checking gap until 0.020 − 0.055 inch (0.51 − 1.40 mm) limit is met.

R CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86447 OR PWA 86652 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

R (12) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

R NOTE: Two blades and one blade lock are to remain in the disk. These are the Type B and C blades and the blade lock that were installed and tightened at the start of this procedure.

R (13) Apply Antigallant Compound P06-036 or Dry Film Lubricant P06-041 to ladder seals (side opposite flat side) and to drum groove in the areas shown to ease the assembly operation. See Figure 1007.

R (14) Install the right side ladder seals, blades, and lock and setscrew assembly. See Figure 1006.

R NOTE: The blades will be installed in the order that they were removed.

R (a) Put the first ladder seal over the loading slot with the flat surface out.

R (b) Align the first opening in the ladder seal with the loading slot in the disk.

R (c) Install the blade that was last removed from the right side (blade Number 54), leading edge up, through the ladder seal and into the loading slot.

R (d) Move the blade and ladder seal to the right until the second opening is aligned with the loading slot.

R NOTE: Be sure that the ladder seal is correctly installed between the disk rails.

R (e) Install the next two Type A blades to complete the assembly of the first ladder seal. Move this blade and seal assembly fully to the right until it touches the Type B blade that is installed.

R (f) Install the next two Type A blades and move them
R fully to the right until they touch the blade and
R ladder seal assembly that was installed.

R (g) Put the second ladder seal over the loading slot
R with the flat surface out.

R (h) Install the next three Type A blades in the
R ladder seal by the method used above and move the
R assembly fully to the right until it touches the
R last Type A blade that is installed.

R (i) Install a Type C blade, a lock and setscrew
R assembly, then the next Type B blade. Move them
R fully to the right until they touch the blades
R that were installed before.

R NOTE: Do not tighten the lock and setscrew
R assembly.

R (j) Put the third ladder seal over the loading slot
R with the flat surface out.

R (k) Install the remaining 19 Type A blades, from
R Column 2, in the ladder seal by the method used
R for the first ladder seal and move the assembly
R fully to the right until it touches the Type B
R blade that is installed.

R (15) Install partial left side ladder seals, blades and a
R lock and setscrew assembly. See Figure 1006.

R NOTE: The blades will be installed in the order that
R they were removed.

R (a) Put the first ladder seal over the loading slot
R with the flat surface out.

R (b) Align the first opening in the ladder seal with
R the loading slot in the disk.

R (c) Install the blade that was last removed (blade
R Number 1), leading edge up, through the ladder
R seal and into the loading slot.

R (d) Move the blade and ladder seal to the left until the second opening is aligned with the loading slot.

R NOTE: Be sure that the ladder seal is correctly installed between the disk rails.

R (e) Install the next 18 Type A blades to complete the assembly of the first ladder seal. Move this assembly fully to the left until it touches the Type C blade that is installed.

R NOTE: Eight Type A blades remain that are not installed.

R (f) Install a Type B blade, a lock and setscrew assembly, then the next Type C blade. Move them fully to the left until they touch the blade and ladder seal assembly that was installed before.

R NOTE: Do not tighten the lock and setscrew assembly.

R (g) Put the second ladder seal over the loading slot with the flat surface out.

R (h) Install the next three Type A blades in the ladder seal by the method used for the first ladder seal and move the assembly fully to the left until it touches the Type C blade that is installed.

R NOTE: Five Type A blades, one Type B blade, one Type C blade and one lock assembly remain.

R (16) Install the remaining blades and lock and setscrew assembly.

R (a) Install the remaining Type C blade and move it fully to the right until it touches the blade that was installed before.

R (b) Install the last lock and setscrew assembly in the drum slot and move it to the left.

R NOTE: Do not tighten the lock.

R (c) Install the remaining Type B blade and move it fully to the right until it touches the blade that was installed before.

(d) Put the ladder seal over the loading slot with the flat surface out.

(e) Align the first opening in the ladder seal with the loading slot in the disk.

(f) Install, in the order that follows, blade Numbers 53, 51, then Number 49 through the ladder seal opening and into the loading slot. Move the assembly fully to the right.

NOTE: Two Type A blades have not been installed.

(g) The last Type A blades can only be inserted in the drum by moving all blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screw.

(h) Rotate the drum 180 degrees again to the opposite loading slot.

(i) Move all blades, ladder seals and locks to the right, as necessary to install blade Number 47 then Number 45.

(17) Move the blades, ladder seals and locks to the final positions.

(a) Move all blades, ladder seals and locks to the left. Align the blade lock with the V mark you made on the drum at beginning of this procedure.

(b) Position, tighten and torque the lock and setscrew assembly that is located at the locking slot near the V mark.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(18) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform with the PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

R (b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R (c) If these limits are not kept, check the lock for correct assembly in the disk.

R (19) Position, tighten and torque the remaining lock and setscrew assemblies.

R (a) Check the gaps, all gaps between the ladder seals should be approximately equal.

R (b) Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

R (20) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow: See Figure 1004 (Sheet 1).

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R (c) If these limits are not kept, check the lock for correct assembly in the disk.

E. Postrequisites

(1) Assemble 9th stage blades to (debladed) axial compressor rotor assembly. See Assembly-27, CONFIG-2 (Task 72-35-01-440-025).

Previous Pageblock Return to Previous Menu Next Pageblock

Task 72−35−01−440−015:

1. Assemble 9Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 10th stage blades to (debladed) axial compressor rotor assembly. See Assembly−26, CONFIG−1 (Task 72−35−01−440−014).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 86571	Gage Set
PWA 85595	Spreader
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06−036	Compound, Antigallant (PWA 36035)
P06−041	Lubricant, Dry Film (PWA 36221)

C. Procedure
See Figure 1001, Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

NOTE: There are four part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type D is used for fitting and may require platform grinding. SB PW4ENG 72−434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. For ease of assembly, blades in this procedure will be referred to as Types A, B, C and D.

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-27

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 9. This procedure is optional and can only be used where blades have been removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
9	22.844 inch (580.238 mm)	22.852 inch (580.441 mm)	22.848 inch (580.339 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Remove 9th stage blades from storage rack and place them on bench. Segregate eight Types B and C blades having notches in their platforms and move to one side. Also locate eight Type D blades and move to one side. See Figure 1001.

(3) Optional, weigh the 9th stage blades. Use an approved marking pen to make marks temporary on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange Type A blades in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(5) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

(6) Selecting one of the blade sets, and with loading slot of disk facing operator, install one Type C blade leading edge up, into slot. Move blade to right. Install one lock and setscrew and move to right. Install one Type B blade into slot. Move to right. See Figure 1004 (Sheet 1).

(7) From the same set, install remaining Type B blade into slot and move to left. Install one lock and setscrew and move to left. Install remaining Type C blade and move to left. See Figure 1004 (Sheet 2).

(8) Locate locking slot to left of blade loading slot. Move left lock to left locking slot and tighten and torque setscrew to running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(9) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(10) Using approved marking pen, mark OD platform of drum in line with lock with "V" for future reference.

(11) Move Type C blade (right side of lock) to the left to rest against lock. See Figure 1004 (Sheet 3).

(12) Move Type B blade and right lock to left and lock setscrew to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

(13) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(14) Push two remaining Types B and C blades to butt against just-installed locks. See Figure 1004 (Sheet 3).

(15) Rotate drum 180 degrees. Position open blade slot toward operator.

(16) Starting at bottom of 4th column of weight−ordered Type A blades, and proceeding vertically from bottom of column to top, position each blade into loading slot and move to right to rest against previously installed blades and lock. When 4th column of blades is used, start at bottom of 2nd column and position each blade into loading slot and to right until all blades from Column 2 are inserted.

(17) Starting at top of 3rd column of blades, position each blade into loading slot and move to left to rest against blades at opposite end. When 3rd column of blades is used, start at top of 1st column and position each blade into loading slot and to left until all blades from Column 1 are inserted.

(18) Install two blades from remaining Types B and C sets into loading slot and move to left. Install remaining two blades from set Types B and C to slot and move to right. Remaining blades should be eight Type D blades which will be used for fitting. Install seven of the Type D blades in slot and load all blades tangentially so as to form widest possible gap at disk loading slot. Measure gap using PWA 85595 Spreader. See Figure 1005.

- (a) Place spreader into vacant blade space. Expand spreader with torque handle and measure blade gap with a vernier caliper. Record this dimension.
- (b) Measure platform width of Type D blade, not installed in drum, with vernier caliper. Record this dimension.
- (c) Compare the gap dimension with the blade platform width dimension.
- (d) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap measured at the drum loading slot between the blades.
- (e) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

(19) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type D blades with oversized blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the standard Type D blades with the modified blades with wider platforms or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

(20) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

(a) If blade platform width is larger than the gap, determine the difference. If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type D blade not installed. If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type D blade not installed. Maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

(b) If total amount of material to be removed exceeds 0.010 inch (0.254 mm), remove additional Type D blade to obtain proper fit and remove material in approximately equal amounts from both sides of Type D blade platform.

(c) If total amount of material to be removed exceeds 0.080 inch (2.032 mm), remove additional Type A blades in addition to Type D blades as required to obtain the 0.020 - 0.055 inch (0.51 - 1.40 mm) fit. Remove material in equal amounts from both sides of platform on these Types D and A blades. Maximum material removal per platform side must not exceed 0.005 inch (0.127 mm). Type A blades with trimmed platforms must be identified with a square symbol in their respective service time marking areas. See 70-11, Standard Practices Manual, PN 585005.

(d) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). SB PW4ENG 72-434 provides blades with platforms that are 0.015 inch (0.381 mm) oversize. If the 0.055 inch (1.397 mm) maximum gap limit is not met, interchange these wider platform blades with Type A blades as needed to meet the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(21) If necessary, grind HPC 9th stage blade platforms per 72-35-38, Assembly-02 (Task 72-35-38-440-002). As an alternate to grinding platforms on Type A and/or Type D blades, PN 52H409 blades may be used in their place. These blades have platforms which are preground to 0.010 inch (0.254 mm) undersize. Replace one or more Type A and/or Type D blades with the preground blade as required to obtain the 0.020 - 0.055 inch (0.51 - 1.40 mm) fit.

(22) If grinding of blade platforms was required, install Type D blades in slot and check gap. Continue grinding and checking gap until 0.020 - 0.055 inch (0.51 - 1.40 mm) limit is met.

(23) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

NOTE: Four blades are to remain in disk. These are the first set of four blades (two Types B and C) and two blade locks installed at beginning of this procedure.

(24) Apply Antigallant Compound P06-036 or Dry Film Lubricant P06-041 to seals (side opposite flat side) and to drum groove.

(25) Aligning slots, prepare to install blade seal to drum, flat side out. Seal will be installed from left to right. Selecting blades from bench in same order in which they were previously installed in right side of drum, install blades to seal and drum, and move (slide) blade and seal to right. See Figure 1005.

NOTE: Use nonmetallic drift and mallet to move blades and seals around drum.

(26) Install remaining right side blades into seal and drum per schematic view Figure 1006. Install four Type D blades equally spaced as per figure.

(27) When blades and seal have been installed at right side, install left side blades and seal per instructions above except moving blades and seal from right to left. See Figure 1006. Install four Type D blades equally spaced as per figure.

(28) At this point, four (two Types B and C) blades of the second set should remain on bench. Install Type C blade into drum slot and move to right. Install Type B blade into slot and move left.

(29) Install blade lock and move to right. Install remaining Type B blade and move to right. The last Type C blade and lock can only be inserted in drum by shifting all blades to right. Therefore, rotate drum 180 degrees and loosen blade lock screws. Move all blades and seals to right. Install blade lock in drum slot and move left. Install Type C blade in drum.

(30) Move all blades and seals to left, aligning one blade lock with "V" mark made on drum at beginning of this procedure. Tighten and torque all blade locks to running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use PWA 83135 Driver and PWA 83136 Extension for multispline setscrews.

(31) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

- (a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform. See Figure 1004 (Sheet 3).
- (b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank. If these limits are not kept, check the lock for correct assembly in the disk.

(32) Use a feeler gage to measure the gap, which extends between the loading slots, in each 180 degree arc on the two sides of the drum. Each arc must have a 0.010 - 0.030 inch (0.254 - 0.762 mm) gap, measure both sides at the same time. If the gap in not in limit, you must change blades from one side of the rotor to the other, or additional material can be removed from the blade platforms on the side that is too tight. If material is removed you must also keep the 0.020 - 0.055 inch (0.51 - 1.40 mm) gap limit.

D. Postrequisites

(1) Assemble 8th stage blades to (debladed) axial compressor rotor assembly. See Assembly-28 (Task 72-35-01-440-016).

AXIAL COMPRESSOR ROTOR ASSEMBLY - ASSEMBLY-27

Task 72-35-01-440-025:

1. Assemble 9Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 10th stage blades to (debladed) axial compressor rotor assembly. See Assembly-26, CONFIG-2 (Task 72-35-01-440-024).

B. Equipment And Materials Necessary

Special Tools:

PWA 78064	Gage
PWA 83135	Driver
PWA 83136	Extension
PWA 85595	Spreader
PWA 86447	Drift
PWA 86571	Gage Set
PWA 86652	Drift (Optional To PWA 86447)

Consumable Materials:

Item No.	Designation
P06-036	Compound, Antigallant (PWA 36035)
P06-041	Lubricant, Dry Film (PWA 36221)

C. Measurement of Z-Plane for HPC Stage 9.

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameter for Stage 9. This procedure is optional and can only be used where blades have been removed. Select the pair of gages from the PWA 86571 Z-Plane Diameter Gage Set. Install gages 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Calculate Z-Plane diameter of the stage by subtracting twice the reference dimension, marked on each pair of gages, from the average diameter measured over the gage tools balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
9	22.844 inch (580.238 mm)	22.852 inch (580.441 mm)	22.848 inch (580.339 mm)

HPC Front Drum Z−Plane Diameters
Table 1001

D. Procedure

NOTE: There are three part numbers (sets) of blades provided for this stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. For ease of assembly, blades in this procedure will be referred to as Types A, B and C.

NOTE: (Post SB PW4ENG 72−703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN THE ASSEMBLY PROCEDURE WHICH FOLLOWS, USE THE PWA 86652 DRIFT OR THE PWA 86447 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(1) Remove 9th stage blades from storage rack and place them on bench. Segregate four each of Types B and C blades having notches in their platforms and move to one side. See Figure 1001. R

(2) Optional, weigh the 9th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70−11−00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps

are not required if subsequent rotor balance procedures are carefully done.

R (3) Optional, arrange Type A blades in two columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. The lightest blade will be at bottom of Column 2. See Figure 1002.

NOTE: One or more Type A blade may have been used as a fitting blade. Blade will be identified by a square in the service time marking area.

(4) Select two sets of four blades (two Types B and C per set) such that weights of sets are as nearly equal as possible. See Figure 1003.

NOTE: Weights must be nearly equal as sets will be positioned opposite each other after assembly.

R (5) Install blades and lock and setscrew assemblies on the right side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

R (a) Find one of two 9th stage loading slots.

R (b) Select one of the Type B and C blade sets. Install one Type C blade, leading edge up, into the slot. Move the blade to the right.

R (c) Install one lock and setscrew assembly and move it to the right.

R (d) Locate the locking slot, at Position K, on the right of the blade loading slot. Move the lock and setscrew assembly into the locking slot and tighten. Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

R NOTE: There are four locking slots that are not used. They are located at, Positions J, on the left and right sides of both loading slots.

R (e) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

1 Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

2 Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

3 If these limits are not kept, check the lock for correct assembly in the disk.

(f) Use an approved marking pen to make a V mark on the outside diameter platform of the drum and in line with the lock. This mark will be used for future reference.

(g) Install one Type B blade into slot and move it to the right until it touches the lock and setscrew assembly.

(h) Rotate the drum 180 degrees. Position the open loading slot toward the operator.

(i) Find the Type A blades to be installed. Start at the bottom of Column 2 (blade Number 58) and continue up to the top of the column (blade Number 2).

(j) Install 20 Type A blades, start with blade Number 58, in the loading slot and move each blade to the right until it touches the blade that was installed before.

(k) Install the remaining Type C blade and move it to the right until it touches the last Type A blade.

(l) Insert one lock and setscrew assembly and move it to the right until it touches the Type C blade.

NOTE: Do not tighten the lock.

(m) Install the remaining Type B blade into the loading slot and move it to the right until it touches the lock and setscrew assembly.

(n) Install the 9 remaining Type A blades from Column 2 in the loading slot and move them to the right until each one touches the blade that was installed before.

(6) Install blades and lock and setscrew assemblies on the left side. See Figure 1002, Figure 1003, Figure 1004, Figure 1005 and Figure 1006.

(a) Get a Type C blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the right until it touches the blade that was installed before.

(b) Install a lock and setscrew assembly in the loading slot and move it to the right until it touches the blade that was installed before.

NOTE: Do not tighten the lock.

(c) Install a Type B blade in the loading slot and move it to the right until it touches the lock.

(d) Find the Type A blades to be installed. Start at the top of Column 1 (blade Number 1) and continue down to the bottom of the column (blade Number 57).

(e) Install 9 Type A blades, start with blade Number 1, in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Twenty Type A blades remain that are not installed.

(f) Get a Type B blade from the remaining Type B and C blade set. Install it in the loading slot and move it to the left until it touches the blade that was installed before.

(g) Install a lock and setscrew assembly in the loading slot and move it to the left until it touches the blade that was installed before.

NOTE: Do not tighten the lock.

(h) Install a Type C blade in the loading slot and move it to the left until it touches the lock.

R (i) Install, in the order that follows, blade Numbers 57, 55, 53, 51, 49, 47, 45, 43, then Number 41 in the loading slot and move them fully to the right.

R (j) Install, in the order that follows, blade Numbers 19, 21, 23, 25, 27, 29, 31, 33, 35, then Number 37 in the loading slot and move them fully to the left.

R NOTE: Blade Number 39 is not installed.

R (7) Move the blades tangentially to make the widest possible gap between the last installed Type A blades. This gap will be measured and used to compute the specified gap for between the blades.

R NOTE: Put the blades in a radially outward direction to prevent a circumferentially serpentine shape to the blades.

R (a) Use a PWA 85595 Spreader to load all blades, in the arc, tangentially.

R (b) When it is installed, expand the spreader and get the widest possible gap between the blade platforms. If you need help to move the blades, it is permissible to tap lightly on the base of the airfoil with a PWA 86447 or PWA 86652 Drift.

R (c) Measure and record the gap dimension.

R (d) Find the last blade to be installed. Measure and record the width of the blade platform using a vernier caliper.

R (e) Compare the gap dimension with the blade platform width.

R (f) The width of the blade platform must measure 0.020 − 0.055 inch (0.51 − 1.40 mm) smaller than the gap dimension.

R (g) If the blade platform width is larger than the gap, subtract the gap dimension from the blade platform width to find the difference.

R (8) Do the procedure that follows to get the correct blade platform width for the measured gap.

NOTE: If the measured gap at the blade loading slot is larger than the measured blade platform, replace the necessary number of Type A blades or Type A blades with the narrower platform width to get the correct blade platform gap of 0.020 - 0.055 inch (0.51 - 1.40 mm).

NOTE: (Post SB PW4ENG 72-703) A Type A blade with a 0.010 inch (0.254 mm) narrower platform width is available to help you get the correct platform gap. One or more of these blades can be used to get the correct platform gap.

(a) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm). If the 0.055 inch (1.397 mm) maximum gap limit is not met, replace the Type A blades or the Type A blades with the narrower platform as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) limit.

(b) If more than one of the narrow platform blades is used, equally space them around the disk during reassembly.

R (9) If it is necessary to remove material from the blade platform to get the correct gap dimension do the following.

R (a) If blade platform width is larger than the gap,
R determine the difference.

R (b) If the total material to be removed does not exceed 0.005 inch (0.127 mm), remove material from either or both sides of the one Type A blade not installed.

R (c) If total amount of material to be removed exceeds of 0.005 inch (0.127 mm) but is no more than 0.010 inch (0.253 mm), remove material in approximately equal amounts from both sides of the Type A blade not installed. The maximum material removed per platform side must not exceed 0.005 inch (0.127 mm).

R (d) If total amount of material to be removed is more than 0.010 inch (0.254 mm), remove additional Type A blades to get the proper fit and remove material in approximately equal amounts from both sides of Type A blade platforms.

R (e) If total amount of material to be removed is more than 0.080 inch (2.032 mm) do as follows:

R 1 Remove additional Type A blades as necessary to get the 0.020 - 0.055 inch (0.51 - 1.40 mm) fit.

R 2 Remove material in equal amounts from both sides of platform on these Types A blades.

R 3 The maximum material removal for each platform side must not be more than 0.005 inch (0.127 mm).

R (f) Type A blades with trimmed platforms must be identified with a square symbol in their
R respective service time marking areas. Refer to
R Standard Practices Manual, PN 585005, Section
R 70-11-00 for approved marking pens.

R (g) The maximum permissible combined loose fit between all blade platforms in a stage is 0.055 inch (1.397 mm).

R (10) If necessary, grind HPC 9th stage blade platforms per 72-35-38 Assembly-02 (Task 72-35-38-440-002).

R (11) If grinding of blade platforms was required, install Type A blades in slot and check gap. Continue grinding and checking gap until 0.020 - 0.055 inch (0.51 - 1.40 mm) limit is met.

R (12) After gap limits have been met, remove all blades from right side of slot and place them in order of removal on bench. Remove all blades from left side of slot and place them in order of removal on bench.

R NOTE: Two blades and one blade lock are to remain in
R disk. These are the first Types B and C blades
R and blade lock that were installed and tightened
R at the start of this procedure.

R (13) Apply Antigallant Compound P06-036 or Dry Film Lubricant P06-041 to ladder seals (side opposite flat side) and to drum groove in the area shown to ease assembly. See Figure 1007.

R (14) Install the right side seals, blades and lock and setscrew assembly. See Figure 1006.

R NOTE: The blades will be installed in the order that they were removed.

R (a) Put the first ladder seal over the loading slot with the flat surface out.

R (b) Align the first opening in the seal with the loading slot in the disk.

R (c) Install the blade that was last removed from the right side (blade Number 58), leading edge up, through the seal and into the loading slot.

R (d) Move the blade and seal to the right until the second opening is aligned with the loading slot.

R NOTE: Be sure that the seal is correctly installed between the disk rails.

R (e) Install the next eight Type A blades to complete the assembly of the first ladder seal. Move this blade and seal assembly fully to the right until it touches the Type B blade that is installed.

R (f) Install the next two Type A blades and move them fully to the right until they touch the blade and seal assembly that was installed.

R (g) Put the second ladder seal over the loading slot with the flat surface out.

R (h) Install the next nine Type A blades in the ladder seal by the method used above and move the assembly fully to the right until it touches the last Type A blade that is installed.

(i) Install a Type C blade, a lock and setscrew assembly, then the next Type B blade. Move them fully to the right until they touch the blades that were installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(j) Put the third ladder seal over the loading slot with the flat surface out.

(k) Install the remaining nine Type A blades, from Column 2, in the ladder seal by the method used for the first seal and move the assembly fully to the right until it touches the Type B blade that is installed.

(15) Install partial left side seals, blades and a lock and setscrew assembly.

NOTE: The blades will be installed in the order that they were removed.

(a) Put the first ladder seal over the loading slot with the flat surface out.

(b) Align the first opening in the seal with the loading slot in the disk.

(c) Install the blade that was last removed (blade Number 1), leading edge up, through the seal and into the loading slot.

(d) Move the blade and seal to the left until the second opening is aligned with the loading slot.

NOTE: Be sure that the seal is correctly installed between the disk rails.

(e) Install the next eight Type A blades to complete the assembly of the first ladder seal. Move this assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Twenty Type A blades remain that are not installed.

(f) Install a Type B blade, a lock and setscrew assembly, then the next Type C blade. Move them fully to the left until they touch the blade and seal assembly that was installed before.

NOTE: Do not tighten the lock and setscrew assembly.

(g) Put the second ladder seal over the loading slot with the flat surface out.

(h) Install the next nine Type A blades in the ladder seal by the method used for the first seal and move the assembly fully to the left until it touches the Type C blade that is installed.

NOTE: Eleven Type A blades, One Type B blade, one Type C blade and one lock assembly remain.

(16) Install the remaining blades and lock and setscrew assembly.

(a) Install the remaining Type C blade and move it fully to the right until it touches the blade that was installed before.

(b) Install the last lock and setscrew assembly in the drum slot and move it to the left.

NOTE: Do not tighten the lock.

(c) Install the remaining Type B blade and move it fully to the right until it touches the blade that was installed before.

(d) Put the ladder seal over the loading slot with the flat surface out.

(e) Align the first opening in the seal with the loading slot in the disk.

(f) Install, in the order that follows, blade Numbers 57, 55, 53, 51, 49, 47, 45, 43, then Number 41 through the seal opening and into the loading slot. Move the assembly fully to the right.

NOTE: Two Type A blades have not been installed.

(g) The last Type A blades can only be inserted in the drum by moving all blades to the right. To do this, you must rotate the drum 180 degrees and loosen the blade lock screw.

(h) Rotate the drum 180 degrees again to the opposite loading slot.

(i) Move all blades, seals and locks to the right, as necessary to install blade Number 39 then Number 37.

(17) Move the blades, seals and locks to the final positions.

(a) Move all blades, seals and locks to the left. Align the blade lock with the V mark you made on the drum at beginning of this procedure.

(b) Position, tighten and torque the lock and setscrew assembly that is located at the locking slot near the V mark.

1 Torque the setscrew to the running torque plus 4 − 8 lb−in. (0.452 − 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi−spline setscrews.

(18) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow:

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

(c) If these limits are not kept, check the lock for correct assembly in the disk.

(19) Position, tighten and torque the remaining lock and setscrew assemblies.

R (a) Check the gaps, all gaps between the ladder seals should be approximately equal.

R (b) Torque the setscrew to the running torque plus 4 - 8 lb-in. (0.452 - 0.904 N.m). Use a PWA 83135 Driver and PWA 83136 Extension for multi-spline setscrews.

R (20) Check the clearance of the blade lock and the top of the blade platform by one of the methods that follow: See Figure 1004.

(a) Method 1: Measure the height clearance between blade lock and the top of the blade platform, with PWA 78064 Gage. Lock shank must be flush to 0.035 inch (0.889 mm) below blade platform.

(b) Method 2: The lock shank top surface must be approximately flush with or below the blade platform. The top of the setscrew can have up to one full thread exposed above or recessed below the face of the lock shank.

R (c) If these limits are not kept, check the lock for correct assembly in the disk.

E. Postrequisites

(1) Assemble 8th stage blades to (debladed) axial compressor rotor assembly. See Assembly-28 (Task 72-35-01-440-016).

Task 72-35-01-440-016:

1. Assemble 8Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 9th stage blades to (debladed) axial compressor rotor assembly. See Assembly-27, CONFIG-1 (Task 72-35-01-440-015) or CONFIG-2 (Task 72-35-01-440-025).

B. Equipment And Materials Necessary

Special Tools:

	PWA 78014	Bender, Pneumatic (Replaced By PWA 100013 Change Letter B)
	PWA 85198	Ring, Retaining
	PWA 86520	Bender, Mechanical (Optional to PWA 78014)
	PWA 86571	Gage Set
	PWA 87123	Bender, Mechanical (Optional to PWA 86520)
R R	PWA 100013	Bender Change Letter B, Pneumatic (Initial Bend) (Replaces PWA 78014) (Optional To PWA 106226)
	PWA 102171	Bender, Pneumatic (Final Bend) (Optional to PWA 106227)
R	PWA 106226	Bender, Pneumatic (Initial Bend)
	PWA 106227	Bender, Pneumatic (Final Bend)

Consumable Materials:

Item No.	Designation
P09-015	Sealing Compound (PWA 544)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	53	72-35-00/2/90

C. Procedure

CAUTION: DO NOT OVERTIGHTEN GAGE SET SCREWS DURING INSTALLATION OF GAGES. DAMAGE TO THE DRUM CAN RESULT.

(1) Measure Z-Plane diameters for Stage 8. This procedure is optional and can only be used where blades have been

removed. Select the pair of gages, marked for that stage, from the PWA 86571 Z-Plane Diameter Gage Set. Install gages, 180 degrees apart, in blade slots. Turn gage set screws clockwise to move the gages radially out to their most outward position. Use OD micrometers to measure four diameters, every 45 degrees, over the gage tool balls. Add the two reference dimensions and subtract from the average diameter, measured over the gage balls. Refer to minimum, maximum and nominal Z-Plane diameters listed, for reference only, in Table 1001.

Stage	Minimum Diameter (Reference)	Maximum Diameter (Reference)	Nominal Diameter (Reference)
8	22.750 inch (577.850 mm)	22.762 inch (578.115 mm)	22.756 inch (578.002 mm)

HPC Front Drum Z-Plane Diameters
Table 1001

(2) Prepare Sealing Compound P09-015.

(a) Sealant must be stirred vigorously immediately prior to application.

(b) Sealant must be kept covered in airtight polyethylene container when not being mixed or used.

(c) Usable working life of sealant is limited to maximum of 14 days. Unused material must not be used beyond this time limit.

(d) After preparation, surfaces to be coated must be handled only with clean gloves. Extreme care must be exercised to avoid contamination with oil, grease, and other foreign materials. If sealant application is not performed immediately after cleaning, prepared surfaces should be suitably protected against contaminants.

(e) Sealed and assembled parts must not be subjected to any mechanical stressing until cure has been completed.

(f) Surfaces to be sealed must not exceed 100°F (37.8°C) during application of sealant.

(g) Sealed surfaces of parts must be suitably protected against damage during handling and shipping.

(3) Optional, weigh the 8th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(4) Optional, arrange 8th stage blades in four columns of 13 blades, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Remaining lightest blade will be at bottom left (Column 1). See Figure 1001.

(5) Prior to applying sealant, wipe blade areas to be sealed by SPOP 208 Wipe Method Standard Practices Manual, PN 585005, 70-21-00.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(6) Install PWA 85198 Retaining Ring just below blade slots. Starting with lightest (bottom) blade in Column 4, apply Sealing Compound P09-015, in areas shown in Figure 1002, and install blade in drum slot, leading edge up.

(7) Grasp blade and pull outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(8) Remove excess sealant from blade lock area and around blade root area. Fill in any voids.

R
R

AXIAL COMPRESSOR ROTOR ASSEMBLY − ASSEMBLY−28

(9) Repeating sealant application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in order selected, and in a counterclockwise direction.

(10) After all blades in Column 4 are installed, move to bottom of Column 2, repeat compound application procedure, and install blades from Column 2, selecting blades vertically upward from lighter blades to heavier blades. Install blades in counterclockwise direction.

(11) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat compound application and blade installation procedures.

(12) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat compound application and blade installation procedures.

(13) Check that all of the Stage 8 blades are installed in drum, then retain the blades by inserting wire locks in the wire lock grooves in a clockwise direction when viewed from the front. Bend the blade locks. Use a PWA 86520 Bender or a PWA 87123 Mechanical Bender for the initial and final bend. Use a PWA 78014 Bender or
R a PWA 100013 Pneumatic Bender Change Letter B or a PWA
R 106226 Pneumatic Bender for the initial bend and a PWA 102171 or PWA 106227 Pneumatic Bender for the final bend to crimp the locks. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 1003.

NOTE: If you use the PWA 78014 Bender, you must use the pre bend and final bend jaws.

(14) Remove PWA 85198 Retaining Ring from around drum. Remove excess sealant from blade root area. Fill in any voids.

D. Postrequisites

(1) Assemble 7th stage blades to (debladed) axial compressor rotor assembly. See Assembly−29 (Task 72−35−01−440−017).

Task 72-35-01-440-017:

1. Assemble 7Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly

A. Prerequisites

(1) Assemble 8th stage blades to (debladed) axial compressor rotor assembly. See Assembly-28 (Task 72-35-01-440-016).

B. Equipment And Materials Required

Special Tools:

	PWA 78014	Bender, Pneumatic (Replaced By PWA 100013 Change Letter B)
	PWA 85197	Ring, Retaining

	PWA 106227	Bender, Pneumatic (Final Bend)

Consumable Materials:

Item No.	Designation
P09-015	Sealing Compound (PWA 544)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	56	72-35-00/2/60

C. Procedure

(1) Prepare Sealing Compound P09-015.

(a) Sealant must be stirred vigorously immediately prior to application.

(b) Sealant must be kept covered in airtight polyethylene container when not being mixed or used.

(c) Usable working life of sealant is limited to maximum of 14 days. Unused material must not be used beyond this time limit.

(d) After preparation, surfaces to be coated must be handled only with clean gloves. Extreme care must be exercised to avoid contamination with oil, grease, and other foreign materials. If sealant application is not performed immediately after cleaning, prepared surfaces should be suitably protected against contaminants.

(e) Sealed and assembled parts must not be subjected to any mechanical stressing until cure has been completed.

(f) Surfaces to be sealed must not exceed 100°F (37.8°C) during application of sealant.

(g) Sealed surfaces of parts must be suitably protected against damage during handling and shipping.

(2) Optional, weigh the 7th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

(3) Optional, arrange 7th stage blades in four columns of 14 blades, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Remaining lightest blade will be at bottom right (Column 4). See Figure 1001.

(4) Prior to applying sealant, wipe blade areas to be sealed by SPOP 208 Wipe Method Standard Practices Manual, PN 585005, 70-21-00.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DRUM, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(5) Install PWA 85197 Retaining Ring just below blade slots. Starting with lightest (bottom) blade in Column 4, apply Sealing Compound P09-015, in areas shown in Figure 1002, and install blade in drum slot, leading edge up.

(6) Grasp blade and pull outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(7) Remove excess sealant from blade lock area and around blade root area. Fill in any voids.

(8) Repeating sealant application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in order selected, and in a counterclockwise direction.

(9) After all blades in Column 4 are installed, move to bottom of Column 2, repeat compound application procedure, and install blades from Column 2, selecting blades vertically upward from lighter blades to heavier blades. Install blades in counterclockwise direction.

(10) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat compound application and blade installation procedures.

(11) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat compound application and blade installation procedures.

(12) Check that all of the Stage 7 blades are installed in drum, then retain the blades by inserting the wire locks into the wire lock grooves in a clockwise direction when viewed from the front. Bend the blade locks. Use a PWA 86520 Bender or a PWA 87123 Mechanical Bender for the initial and final bend. Use a PWA 78014 Bender or a PWA 100013 Pneumatic Bender
R Change Letter B or a PWA 106226 Pneumatic Bender
for the initial bend and a PWA 102171 or PWA 106227

Pneumatic Bender for the final bend to crimp the locks. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 1003.

NOTE: If you use the PWA 78014 Bender, you must use the pre bend and final bend jaws.

(13) Remove PWA 85197 Retaining Ring from around drum. Remove excess sealant from blade root area. Fill in any voids.

(14) Use one of the following methods to cure the sealing compound. It is better to use the oven method.

(a) Let the sealant cure at room temperature for 48 hours minimum.

(b) Put the assembly in a oven and heat to cure as follows:

1 Preheat the oven to 135° − 165°F (57.3° − 73.9°C).

2 Use appropriate tooling to remove the rotor assembly from the build stand and support it in the oven during the curing operation.

3 Heat the rotor in the oven to 135° − 165°F (57.3° − 73.9°C). Hold at this heat for one hour minimum. The time necessary to make the part this temperature is not included in the cure time.

4 Raise the temperature to 375° − 425°F (190.5° − 218.3°C). Hold at this heat for one hour minimum. The time necessary to make the part this temperature is not included in the cure time.

5 Air cool to room temperature.

D. Postrequisites

(1) Assemble 6th stage blades to (debladed) axial compressor rotor assembly. See Assembly−30 (Task 72−35−01−440−018).

R	PWA 106294	Bender, Pneumatic (Final Bend) (Replaces PWA 100096

Consumable Material:

Item No.	Designation
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock	51	72-35-00/2/30

C. Procedure

(1) Optional, weigh the 6th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

NOTE: Mass weighing and arranging blades by weight in columns is optional and is intended as a good maintenance practice that will result in optimal rotor balance results. However, these steps are not required if subsequent rotor balance procedures are carefully done.

CAUTION: (PRE SB PW4ENG 72-322 AND POST SB PW4ENG 72-322) BLADES ARE DIRECTLY INTERCHANGEABLE AND CAN BE MIXED WITH BLADES, PN 52H306 (SB PW4ENG 72-304).

(2) Optional, arrange 6th stage blades in four columns, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom of Column 3. See Figure 1001.

(3) Prior to applying sealant, wipe blade areas to be sealed by SPOP 208 Wipe Method Standard Practices Manual, PN 585005, 70-21-00.

(4) Install PWA 85196 Retaining Ring around drum just below blade slots.

(5) Immediately before installing each blade, apply Silicone Rubber Sealant P09-014 to the blade root as shown in Figure 1002. Coat blades thickly enough to fill in voids between blade root and disk slot when blade is in the installed position. Also, apply sealant to the lock groove of blades and of the disk at blade locations. See Figure 1002.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DISK, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(6) Starting with lightest (bottom) blade in Column 4, install blades in drum, with leading edge up.

(a) Grasp blade and pull outward to load blade against bearing surface of drum slot. Slowly seat blade completely in drum.

(b) Install the blade lock, from right to left, in the lock groove.

(c) Remove excess sealant from blade lock groove area and from blade root area. Fill in any voids.

(d) Repeating sealant application procedure, install remaining blades from Column 4 continuing vertically upward from lighter blades to heavier blades. Install blades to drum in counterclockwise direction.

(e) After all blades in Column 4 are installed, move to bottom of Column 2, repeat sealant application procedure and install blades from Column 2, relocating blade vertically upward from lighter blades to heavier blades. Install blades in counterclockwise direction.

(f) After all blades in Column 2 are installed, move to bottom of Column 3, and repeat sealant application and blade installation procedure.

(g) After all blades in Column 3 are installed, move to bottom of Column 1, and repeat sealant application and blade installation procedure.

NOTE: When you install the last lock, if it is necessary, you can lightly hit the lock into position.

(7) Bend the blade locks. Use a PWA 86519 Bender or PWA 87129 Mechanical Bender for pre and final bend. Use a
R PWA 78013 Bender or a PWA 100013 Bender or a PWA 106293
R Pneumatic Bender or the PWA 100014 Mechanical Bender
R for the initial bend and a PWA 106294 Pneumatic Bender
R or the PWA 100096 Pneumatic Bender for the final bend
to crimp the locks. See Figure 1003.

NOTE: If you use the PWA 78013 Bender, you must use the pre bend and final bend jaws.

(a) Keep the dimension shown between the rim of the disk and the tip of the lock.

(b) Tangential movement is not permitted in the installed position.

(8) Remove the PWA 85196 Retaining Ring from around the drum.

(9) Remove the unwanted sealant from the blade root, disk slot and blade platform outer face areas. Fill in all voids.

(10) Apply Silicone Rubber Sealant P09-014 to the bent end of all blade locks. All the blade lock ends must be covered. See Figure 1003.

(11) Allow sealant to cure at 20 percent minimum relative humidity and at room temperature for eight hours prior to rotor balance operation and 24 hours prior to engine test.

D. Postrequisites

(1) Assemble 5th stage blades to (debladed) axial compressor rotor assembly. See Assembly-31 (Task 72-35-01-440-019).

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Blade Locks	40	72-35-00/2/10

NOTE: (Post SB PW4ENG 72-373)

C. Procedure

(1) Weigh the 5th stage blades. Use an approved marking pen to make temporary marks on the individual blade airfoils to show the blade weight. See Standard Practices Manual, PN 585005, Section 70-11-00.

CAUTION: STAGE 5 HPC BLADES MUST BE INSTALLED IN COMPLETE SETS ONLY.

CAUTION: THE THICKER 5TH STAGE BLADE (SB PW4ENG 72-174) CAN BE USED WITH THE ORIGINAL SIX STATOR VANE SCHEDULE OR THE LATER 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197). THE ORIGINAL CONFIGURATION 5TH STAGE BLADE (PRE SB PW4ENG 72-174) CAN ONLY BE USED WITH THE ORIGINAL CONFIGURATION SIX STATOR VANE SCHEDULE (PRE SB PW4ENG 72-197).

(2) Arrange 5th stage blades in four columns of 10 blades, starting with heaviest blade at top left (Column 1), and proceeding from left to right in descending order of weight. Lightest blade will be at bottom right (Column 4). See Figure 1001.

(3) Install PWA 85164 Retaining Ring or PWA 85196 Retaining Ring between the airseal and the 5th stage blade slots.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO INSTALL BLADE IN DISK, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(4) Prepare the blades and rotor assembly for the application of PWA 36003, Silicone Rubber Sealant P09-014. Refer to the Standard Practices Manual, PN 585005, Section 70-48.

(5) Use the method that follows to install the blades. Start at the bottom of column 4 (blade number 40) and continue up to the top of the column (blade number 4). Install the blades in counterclockwise direction.

  (a) Use the PWA 83-B2 method to wipe clean the blade areas the will be sealed.

  (b) Apply Silicone Rubber Sealant P09-014, on the areas shown in Figure 1002.

R
R

(c) Install the blade, with the locking groove up, from the front (top) of the blade slot. While you install the blade, pull the blade radially outward to be sure the blade has full contact with the bearing surface of the blade slot.

(d) Install the blade lock, from right to left, in the lock groove. Be sure the lock under the blade is coated with sealant to make sure lock will not roll over after sealant cure.

(e) Remove the unwanted sealant from the blade root, disk slot and blade platform outer face areas. Fill in all voids.

(6) After all blades in Column 4 are installed, use the steps given above and install the blades from Column 2. Start at the bottom and move up the column to heavier blade.

(7) After all blades in Column 2 are installed, use the steps given above and install the blades from Column 3. Start at the bottom and move up the column to heavier blade.

(8) After all blades in Column 3 are installed, use the steps given above and install the blades from Column 1. Start at the bottom and move up the column to heavier blade.

NOTE: When you install the last lock, if it is necessary, you can lightly hit the lock into position.

(9) Bend the blade locks. Use the PWA 78012 Pneumatic Bender or the PWA 86518 Pneumatic Bender or PWA 87128 Mechanical Bender to crimp the wire lock. These bending tools have separate jaws for initial and final bends. After making the initial bend, replace the initial bend jaw with the final bend jaw and compress handles until the blade lock is fully bent. As an option to the PWA 78012 Pneumatic Bender with separate
R jaws for initial and final bends, the PWA 106291
R Pneumatic Bender or the PWA 100012A Pneumatic Bender
R is used for the prebend of the blade lock and the PWA
R 106292 Pneumatic Bender or the PWA 102146 Pneumatic
Bender is used for the final bend of the blade lock. See Figure 1003.

(a) Keep the dimension shown between the rim of the disk and the tip of the lock.

(b) Tangential movement is not permitted in the installed position.

(10) Remove the Retaining Ring from around the drum.

(11) Apply Silicone Rubber Sealant P09−014 to the bent end of all blade locks. All the blade lock ends must be covered. See Figure 1003.

(12) Cure the sealant at 20 percent minimum relative humidity and at room temperature for eight hours before the rotor balance operation and 24 hours before the engine test.

(13) After the sealant has cured, install the rotor assembly in the storage and transport stand. See Figure 1004 and Figure 1005.

(a) Install a PWA 85161 Adapter to the front hub threads and a PWA 85086 Lifting Arm on the adapter.

(b) Use a hoist, that is installed on the lifting arm, to lift the rotor assembly from the build stand.

(c) Install a PWA 85124 or PWA 88700 Adapter to the rear hub threads and a PWA 85086 Lifting Arm on the adapter.

(d) Use a second hoist to trunnion the rotor assembly to horizontal.

(e) Lower the rotor onto a PWA 85337 Transport Stand, then remove the hoists, arms and adapters.

(f) Install a PWA 87383 Plastic Protector to protect the bladed rotor assembly during storage.

D. Postrequisites

(1) Accomplish runouts and balance. See Assembly−02 CONFIG−1 (Task 72−35−01−440−002) or CONFIG−2(Task 72−35−01−440−005).

VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY - DISASSEMBLY-01

Task 72-35-02-040-001:

1. Disassemble Variable Stator Vane And HPC Front Case Assembly
   A. Equipment And Materials Required - None
   B. Procedure
      (1) Place both halves of HPC front case assembly, front end down, on work bench.
      (2) Unbend tabs at each vane arm bolt securing 7th stage arm bolts. Loosen and remove bolts from vanes. Remove key washer and washers. Discard key washers.
      (3) Slide vane arms from vane trunnion and remove ring segment and arms from case. Slide spacers from selected vanes.
      (4) Repeat above steps for Stages 6, 5 and inlet.
      (5) Unbend tabs at each bolt securing runners to front case. Loosen and remove bolts securing runners. Remove and discard key washers. Remove shims and runners from 33 places.
      (6) Remove borescope plugs from 5th and 6th stage on "lower" case.
      (7) Loosen nuts and remove nuts and bolts securing inner shrouds. Remove inner shrouds from case assembly. Remove keys from selected vane bearings.
      (8) Remove all bearings from ID trunnions of vanes and place in container.

CAUTION: (POST SB PW4ENG 72-485) THE 5TH THROUGH 7TH STAGE (OUTER) SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED AND MACHINED AS A MATCHED SET. THESE PARTS MUST BE KEPT TOGETHER AS A SET. IF THE SHROUD SEGMENTS REQUIRE REFURBISHMENT, THEY CAN BE MACHINED IN A DIFFERENT FRONT CASE AND IDENTIFIED WITH THE MATING NUMBER.

      (9) Remove vanes from case assembly. Remove packing and discard. Remove thrust washer from each vane root.

NOTE: It is not necessary to disassemble the HPC front case/outer shroud set for routine cleaning and inspection procedures. The shroud segments must be installed in the mating case for dimensional inspection of the shroud rubstrip for wear in the Engine CIR Manual (PN 51A357), 72-35-40, Inspection/Check-04 (Task 72-35-40-200-004).

Task 72-35-02-440-001:

1. Assemble Variable Stator Vane And HPC Front Case Assembly

A. Equipment And Materials Required

Special Tools:

PWA 87888	Gage

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-021	Antigalling Compound (PWA 550-3)
P06-041	Lubricant, Dry Film (PWA 36221)
P06-054	Paste, Antiseize (PWA 36246)
P09-014	Sealant, Silicone Rubber (Red) (PWA 36003-1)
P09-027	Sealant, Silicone Rubber (Gray) (PWA 36003-2) (Optional For The Ring Case Configuration)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Key Washer	22	72-35-00/12/30
Key Washer	22	72-35-00/13/20
Key Washer	22	72-35-00/14/20
Key Washer	124	72-35-00/12/320
Key Washer	46	72-35-00/14/320
Key Washer	60	72-35-00/15/320

Bearing-Washer	46	72-35-00/14/20 or
Bearing-Washer	46	72-35-00/14/120A
Bearing-Washer	60	72-35-00/15/140 or
Bearing-Washer	60	72-35-00/15/140A

B. Procedure
See Figure 1001.

CAUTION: (POST SB PW4ENG 72-485) THE 5TH THROUGH 7TH STAGE OUTER SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED, MACHINED, AND IDENTIFIED AS A MATCHED SET. MAKE SURE THAT BOTH HALVES OF THE HPC FRONT CASE HAVE THE SAME MATING NUMBER.

(1) Place both halves of HPC front case assembly, large OD down, on bench.

CAUTION: SHROUD SETS AND HPC FRONT CASES WITH FLANGE LOCATING PINS FOR SHROUD SET (PRE SB PW4ENG 72-220) MUST BE USED IN COMPLETE SETS ONLY.

CAUTION: (POST SB PW4ENG 72-485) NEW OR REPAIRED 5TH AND/OR 6TH AND 7TH STAGE SHROUD SETS MUST BE ASSEMBLED IN THE HPC FRONT CASE SET, FINISH MACHINED (TO PROVIDE TRENCHES IN THE SHROUD RUBSTRIPS), AND IDENTIFIED AS A MATCHED SET.

CAUTION: FELTMETAL RUBSTRIPS MUST NOT BE EXPOSED TO ANY LUBRICANT PRIOR TO ENGINE INSTALLATION.

(2) For the symmetric case configuration, install Stage 6 and 7 shroud set to case halves engaging lip in shroud to groove in case. Install 20 bolts, threads lubricated with Engine Oil P03-001 to secure one half of shroud set to one half of front case. Tighten and torque bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). See Figure 1001 (Sheet 1).

NOTE: (Post SB PW4ENG 72-485) Finish machine new or repaired 5th stage and/or 6th and 7th stage shroud sets as required. Refer to the PW4000 Series CIR, PN 51A357 as follows:

NOTE: For case and shroud sets that have 6th and 7th stage shroud sets with feltmetal rubstrips, refer to PW4000 Series CIR, PN 51A357, 72-35-40, Repair-21 . For the 6th and 7th stage shroud sets with plasma coated rubstrips, refer to PW4000 Series CIR, PN 51A357, 72-35-40, Repair-22.

(3) For the symmetric case configuration, clean areas to be filled by Standard Practices Manual, PN 585005, 70-21-00, SPOP 208 Wipe Method.

NOTE: Solvent wiped surfaces shall be thoroughly dried in air at ambient temperature or in oven at 250°F (121°C) maximum. Drying time shall be sufficient to remove traces of solvent detrimental to filling process.

(4) For the non-ring case compressor configuration, apply Silicone Rubber Sealant P09-014 to areas and dimensions shown in Figure 1001 (Sheet 7). Cure in ambient air of 25 percent minimum relative humidity for three hours prior to handling.

(5) (POST SB PW4ENG 72-756) For the symmetric case with the ring case compressor configuration, apply Silicone Rubber Sealant P09-027 or Silicone Rubber Sealant P09-014 to areas around the HPC spacer shown in Figure 1001 (Sheet 7). Cure in ambient air of 25 percent minimum relative humidity for eight hours prior to handling.

(6) Install thrust washer on 7th stage vane trunnion at grooved end. Install packing on vane trunnion to seat in groove. Remove roll from packing. Apply Dry Film Lubricant P06-041 to area of packing per Figure 1001 (Sheet 1).

(7) Insert vane, thickest part of airfoil down, through upper set of bearings in ID of HPC front case. Complete installation of remaining 7th stage vanes, with packings and washers, until total of 60 vanes are installed in both halves of HPC front case assembly.

NOTE: Install five special vanes into each case segment as follows. With assembler facing the ID of either case segment, install the special vanes into hole Locations 2, 3, 16, 28 and 29, starting from the case split line and counting from left to right. Repeat same procedure for remaining case segment. See also Figure 1001 (Sheet 5).

(8) Install thrust washer on 6th stage vane trunnion at grooved end. Install packing on vane trunnion to seat in groove. Remove roll from packing. Apply Dry Film Lubricant P06-041 to area of packing per figure.

(9) Insert vane, thickest part of airfoil down, through set of bearings immediately below previously installed 7th stage vanes in HPC front case. Complete installation of remaining 6th stage vanes, with packings and washers, until total of 46 vanes are installed in both halves of HPC front case assembly.

NOTE: Install five special vanes into each case segment as follows. With assembler facing the ID of either case segment, install the special vanes into hole Locations 2, 3, 12, 21 and 22, starting from the case split line and counting from left to right. Repeat same procedure for remaining case segment. See also Figure 1001 (Sheet 5).

(10) Install thrust washer on 5th stage vane trunnion at grooved end. Install packing on vane trunnion to seat in groove. Remove roll from packing. Apply Dry Film Lubricant P06-041, to area of packing.

(11) Insert vane, thickest part of airfoil down, through set of bearings immediately below previously installed 6th stage vanes in HPC front case. Complete installation of remaining 5th stage vanes, with packings and washers, until total of 48 vanes are installed in both halves of HPC front case assembly.

NOTE: Install five special vanes into each case segment as follows. With assembler facing the ID of either case segment, install the special vanes into hole Locations 2, 3, 13, 22 and 23, starting from the case split line and counting from left to right. Repeat same procedure for remaining case segment. See also Figure 1001 (Sheet 5).

(12) Install thrust washer on HPC inlet vane trunnion at grooved end. Install packing on vane trunnion to seat in groove. Remove roll from packing. Apply Dry Film Lubricant P06-041, to area of packing per figure.

(13) Insert vane, thickest part of airfoil down, through set of bearings immediately below previously installed 5th stage vanes in HPC front case. Complete installation of remaining HPC inlet vanes, with packings and

washers, until total of 76 vanes are installed in both halves of HPC front case assembly.

NOTE: Install five special vanes into each case segment as follows. With assembler facing the ID of either case segment, install the special vanes into hole Locations 2, 4, 20, 35 and 37, starting from the case split line and counting from left to right. Repeat same procedure for remaining case segment. See also Figure 1001 (Sheet 5).

(14) Install bearings to each vane trunnion exposed at ID of HPC front case as follows:

(a) If you install new sleeve bearings, install bearings to each vane trunnion exposed at ID of HPC front case. Install bearings with slots to the selected vanes.

(b) If you do not install new sleeve bearings, you must measure the distance between the sleeve bearings and the shroud as follows: See Figure 1001 (Sheet 8).

NOTE: The following sleeve bearing height check is not required if you install new sleeve bearings.

1 Temporarily assemble the shroud set. Make sure the part numbers agree with the mating parts.

2 Install each sleeve bearing into the mating holes in the shroud set.

3 Measure the distance between the sleeve bearings and the shroud. The sleeve bearing height must be in the limits specified in the referenced figure.

4 Remove the bearings from the shroud set.

5 Disassemble the shroud set.

6 Install bearings to each vane trunnion exposed at ID of HPC front case. Install bearings with slots to the selected vanes.

(15) Install 7th stage shroud on 7th stage vanes so that shroud half with seal land is positioned above bearings and other half of shroud is below bearings. Install keys to special vanes and bearings installed on case. Keys will fit recesses of inner shrouds. Seat both halves of shroud and install 15 bolts (heads up) and nuts. Torque nuts to 27 − 30 lb−in. (3.051 − 3.390 N.m). Complete installation of shroud on both halves of HPC front case assembly. See Figure 1001 (Sheet 2).

(16) Install 6th stage shroud on 6th stage vanes so that shroud half with seal land is positioned above bearings and other half of shroud is below bearings. Install keys to special vanes and bearings installed on case. Keys will fit recesses of inner shrouds. Seat both halves of shroud and install 10 bolts (heads up) and nuts. Torque nuts to 27 − 30 lb−in. (3.051 − 3.390 N.m). Complete installation of shroud on both halves of HPC front case assembly. See Figure 1001 (Sheet 2).

CAUTION: FIFTH STAGE SHROUD SET WITH FIBERMETAL OUTER AIRSEAL DUCTS (SB PW4ENG 72−212) MUST BE USED IN SETS WITH 5TH STAGE BLADES.

(17) Install 5th stage shroud on 5th stage vanes so that shroud half with seal land is positioned above bearings and other half of shroud is below bearings. Install keys to special vanes and bearings installed on case. Keys will fit recesses of inner shrouds. Seat both halves of shroud and install 12 bolts (heads up) and nuts. Torque nuts to 27 − 30 lb−in. (3.051 − 3.390 N.m). Complete installation of shroud on both halves of HPC front case assembly. See Figure 1001 (Sheet 2).

(18) Install IGV stage shroud on IGV stage vanes so that shroud half with rubber seal land is positioned above bearings and other half of shroud is below bearings. Install keys to special vanes and bearings installed on case. Keys will fit recesses of inner shrouds. Seat both halves of shroud and install 10 bolts (heads up) and nuts. Torque nuts to 27 − 30 lb−in. (3.051 − 3.390 N.m). Complete installation of shroud on both halves of HPC front case assembly. See Figure 1001 (Sheet 2).

(19) Secure 11 6th stage runners without shims to case bosses (below 7th stage vanes) with key washers and bolts, threads lubricated with Engine Oil P03−001. Secure bolts fingertight. See Figure 1001 (Sheet 3).

(20) Secure 11 5th stage runners without shims to case bosses (below 6th stage vanes) with key washers and bolts, threads lubricated with Engine Oil P03-001. Secure bolts fingertight.

(21) Secure 11 IGV stage runners without shims to case bosses (below 5th stage vanes) with key washers and bolts, threads lubricated with Engine Oil P03-001. Secure bolts fingertight.

NOTE: For HPC front cases incorporating "short" IGV bosses (Pre SB PW4ENG 72-168), install spacers between the synchronizing ring runners and the case bosses and use longer bolts. See Figure 1001 (Sheet 3).

(22) Install stepped spacers onto ends of the special vanes at Locations 2, 4, 20, 35, and 37 on either case segment, counting from right to left on the OD of the case segment with the large OD down. Refer to Figure 1001 (Sheet 5). Use the Class 1 spacer for the initial measurement.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(23) Install inlet guide vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed. Align the offset edges of the vane arms with the offset slots in the vane shafts and tap lightly until holes in vane arms line up with holes in vane trunnions. Following assembly of vane arms onto vane trunnions, check the outside width of the vane arm claws with PWA 87888 Gage to insure there is no deformation of the claw and that vane arm has been assembled correctly to vane trunnion. Temporarily secure vane arms to vane trunnions with washers and lubed bolts. Tighten bolts with a torque of 35 - 40 lb-in. (3.954 - 4.519 N.m). Repeat for other case segment.

(24) Install stepped spacers at the special vane locations.

(a) (Reference 1401) (Pre SB PW4ENG 72−477) Measure the gap between vane arms and stepped spacers at the special vane locations while the vane is pulled outward and the stepped spacer is seated against the boss. The gap must be 0.005 − 0.016 inch (0.127 − 0.406 mm). If the gap is not within limits, try different class spacers until the desired gap is obtained.

(b) (Post SB PW4ENG 72−477) Install a single spacer which is the same size as the previous Class 1 spacer.

NOTE: SB PW4ENG 72−477 stops the requirement to measure the gap between vane arms and stepped spacers at the special vane locations and select the correct spacer class.

(25) Align holes in arms with threaded holes in vane trunnions. Install 76 bolts, threads lubricated with Engine Oil P03−001, key washers and washers to secure arms to vanes.

(26) (Reference 1551) Tighten and torque the bolts to 35 − 40 lb−in. (3.954 − 4.519 N.m). Bend the tabs of the washers to safety the bolts.

(27) Apply a tangential load, up to 100 lbs. (45.4 kg), to unison ring clevis when vane arms are parallel to engine axis. Vane arms must move through a minimum angle of 5 degrees from their initial position (parallel to engine axis), but in no case should this angle exceed 20 degrees. Loading to be applied in both directions (vanes closing and opening).

(28) Install stepped spacers onto ends of the special vanes at Locations 2, 3, 13, 22, and 23 on either case segment, counting from right to left on the OD of the case segment with the large OD down. Refer to Figure 1001 (Sheet 5). Use the Class 1 spacer for the initial measurement.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY

EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(29) Install Stage 5 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed. Align the offset edges of the vane arms with the offset slots in the vane shafts and tap lightly until holes in vane arms line up with holes in vane trunnions. Following assembly of vane arms onto vane trunnions, check the outside width of the vane arm claws with PWA 87888 Gage to insure there is no deformation of the claw and that vane arm has been assembled correctly to vane trunnion. Temporarily secure vane arms to vane trunnions with washers and lubed bolts. Tighten bolts with a torque of 35 - 40 lb-in. (3.954 - 4.519 N.m). Repeat for other case segment.

(30) Install stepped spacers at the special vane locations.

(a) (Reference 1401) (Pre SB PW4ENG 72-477) Measure the gap between vane arms and stepped spacers at the special vane locations while the vane is pulled outward and the stepped spacer is seated against the boss. The gap must be 0.005 - 0.016 inch (0.127 - 0.406 mm). If the gap is not within limits, try different class spacers until the desired gap is obtained.

(b) (Post SB PW4ENG 72-477) Install a single spacer which is the same size as the previous Class 1 spacer.

NOTE: SB PW4ENG 72-477 stops the requirement to measure the gap between vane arms and stepped spacers at the special vane locations and select the correct spacer class.

(31) Align holes in arms with threaded holes in vane trunnions. Install 48 bolts, threads lubricated with Engine Oil P03-001, key washers and washers to secure arms to vanes.

(32) (Reference 1551) Tighten and torque the bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m). Bend the tabs of the washers to safety the bolts.

(33) Apply a tangential load, up to 100 lbs. (45.4 kg), to unison ring clevis when vane arms are parallel to engine axis. Vane arms must move through a minimum angle of 5 degrees from their initial position (parallel to engine axis), but in no case should this angle exceed 20 degrees. Loading to be applied in both directions (vanes closing and opening).

(34) Install stepped spacers onto ends of the special vanes at Locations 2, 3, 12, 21, and 22 on either case segment, counting from right to left on the OD of the case segment with the large OD down. Refer to Figure 1001 (Sheet 5). Use the Class 1 spacer for the initial measurement.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(35) Install Stage 6 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed. Align the offset edges of the vane arms with the offset slots in the vane shafts and tap lightly until holes in vane arms line up with holes in vane trunnions. Following assembly of vane arms onto vane trunnions, check the outside width of the vane arm claws with PWA 87888 Gage to insure there is no deformation of the claw and that vane arm has been assembled correctly to vane trunnion. Temporarily secure vane arms to vane trunnions with washers and lubed bolts. Tighten bolts with a torque of 35 - 40 lb-in.(3.954 - 4.519 N.m). Repeat for other case segment.

(36) Install stepped spacers at the special vane locations.

(a) (Reference 1401) (Pre SB PW4ENG 72-477) Measure the gap between vane arms and stepped spacers at the special vane locations while the vane is pulled outward and the stepped spacer is seated against the boss. The gap must be 0.005 - 0.016 inch (0.127 - 0.406 mm). If the gap is not within limits, try different class spacers until the desired gap is obtained.

(b) (Post SB PW4ENG 72-477) Install a single spacer which is the same size as the previous Class 1 spacer.

NOTE: SB PW4ENG 72-477 stops the requirement to measure the gap between vane arms and stepped spacers at the special vane locations and select the correct spacer class.

(37) Align holes in arms with threaded holes in vane trunnions. Install 46 bolts, threads lubricated with Engine Oil P03-001, key washers and washers to secure arms to vanes.

(38) (Reference 1551) Tighten and torque the bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m). Bend the tabs of the washers to safety the bolts.

(39) Apply a tangential load, up to 100 lbs. (45.4 kg), to unison ring clevis when vane arms are parallel to engine axis. Vane arms must move through a minimum angle of 5 degrees from their initial position (parallel to engine axis), but in no case should this angle exceed 20 degrees. Loading to be applied in both directions (vanes closing and opening).

CAUTION: FIFTH AND SIXTH STAGE SYNCHRONIZING RING CLEVISES AND 7TH STAGE SYNCHRONIZING RING MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197).

(40) Install stepped spacers onto ends of the special vanes at Locations 2, 3, 16, 28, and 29 on either case segment, counting from right to left on the OD of the case segment with the large OD down. Refer to Figure 1001 (Sheet 5). Use the Class 1 spacer for the initial measurement.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY

EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(41) Install Stage 7 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed. Align the offset edges of the vane arms with the offset slots in the vane shafts and tap lightly until holes in vane arms line up with holes in vane trunnions. Following assembly of vane arms onto vane trunnions, check the outside width of the vane arm claws with PWA 87888 Gage to insure there is no deformation of the claw and that vane arm has been assembled correctly to vane trunnion. Temporarily secure vane arms to vane trunnions with washers and lubed bolts. Tighten bolts with a torque of 35 - 40 lb-in. (3.954 - 4.519 N.m). Repeat for other case segment.

(42) Install stepped spacers at the special vane locations.

(a) (Reference 1401) (Pre SB PW4ENG 72-477) Measure the gap between vane arms and stepped spacers at the special vane locations while the vane is pulled outward and the stepped spacer is seated against the boss. The gap must be 0.005 - 0.016 inch (0.127 - 0.406 mm). If the gap is not within limits, try different class spacers until the desired gap is obtained.

(b) (Post SB PW4ENG 72-477) Install a single spacer which is the same size as the previous Class 1 spacer.

NOTE: SB PW4ENG 72-477 stops the requirement to measure the gap between vane arms and stepped spacers at the special vane locations and select the correct spacer class.

(43) Align holes in arms with threaded holes in vane trunnions. Install 60 bolts, threads lubricated with Engine Oil P03-001, key washers and washers to secure arms to vanes.

(44) (Reference 1551) Tighten and torque bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m). Bend tabs to secure bolts.

(45) Apply a tangential load, up to 100 lbs. (45.4 kg), to unison ring clevis when vane arms are parallel to engine axis. Vane arms must move through a minimum angle of 5 degrees from their initial position (parallel to engine axis), but in no case should this angle exceed 20 degrees. Loading to be applied in both directions (vanes closing and opening).

CAUTION: SIXTH STAGE BORESCOPE PLUG AP3, PN 50H485 MUST BE USED IN CASES INCORPORATING SELF-LOCKING INSERTS (PRE SB PW4ENG 72-326).

(46) (Reference 1552) (Pre SB PW4ENG 72-326) For HPC front case incorporating self-locking helical coil inserts in 6th stage borescope port, remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug to "lower" case, to rear of 6th stage vanes. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). See Figure 1001 (Sheet 4).

NOTE: Install the plug until it contacts the locking coil of the insert. With a torque wrench, turn the plug in with a steady uniform motion. Check that the torque is less than 32 lb-in. (3.616 N.m). Replace the insert if torque exceeds limit.

CAUTION: NEW 6TH STAGE BORESCOPE PLUG AND KEY WASHER CONFIGURATION (POST SB PW4ENG 72-326 AND/OR SB PW4ENG 72-468 AND/OR SB PW4ENG 72-518) MAY BE USED IN CASES INCORPORATING STANDARD SELF-HELICAL INSERTS OR IN CASES INCORPORATING LOCKING HELICAL INSERTS.

(47) (Reference 1552) (Post SB PW4ENG 72-326 and/or SB PW4ENG 72-468 and/or SB PW4ENG 72-518) For HPC front case incorporating self-locking or standard helical coil inserts in 6th stage borescope port, remove excess baked on compound from borescope plug threads using nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug and key washer to "lower" case, to rear of 6th stage vanes. Torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). Bend tabs to secure plug, see Standard Practices Manual, PN 585005, 70-53.

CAUTION: FIFTH STAGE BORESCOPE PLUG AP2, PN 50H271 MUST BE USED IN CASES INCORPORATING SELF-LOCKING INSERTS (PRE SB PW4ENG 72-326).

(48) (Reference 1554) (Pre SB PW4ENG 72-326) For HPC front case incorporating self-locking helical coil inserts in 5th stage borescope port, remove excess baked on compound from borescope plug threads using a nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug to "lower" case, to rear of 5th stage vanes. Run plug in to be sure plug is seated. Tighten and torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). See Figure 1001 (Sheet 4).

NOTE: Install the plug until it contacts the locking coil of the insert. With a torque wrench, turn the plug in with a steady uniform motion. Check that the torque is less than 24 lb-in. (2.712 N.m). Replace the insert if torque exceeds limit.

CAUTION: NEW 5TH STAGE BORESCOPE PLUG AND KEY WASHER CONFIGRATION (POST SB PW4ENG 72-326 AND/OR SB PW4ENG 72-468 AND/OR SB PW4ENG 72-518) MAY BE USED IN CASES INCORPORATING STANDARD SELF-HELICAL INSERTS OR IN CASES INCORPORATING LOCKING HELICAL INSERTS.

(49) (Reference 1554) (Post SB PW4ENG 72-326 and/or SB PW4ENG 72-468 and/or SB PW4ENG 72-518) For HPC front case incorporating self-locking or standard helical coil inserts in 5th stage borescope port, remove excess baked on compound from borescope plug threads using nylon brush. Apply Antiseize Paste P06-054 to threads and washer face of plug. Wipe off unwanted paste. Do not use Engine Oil P03-001. Install plug and key washer to "lower" case, to rear of 5th stage vanes. Torque plug to 175 - 190 lb-in. (19.8 - 21.5 N.m). Bend tabs to secure plug, see Standard Practices Manual, PN 585005, 70-53.

CAUTION: (POST SB PW4ENG 72-485) THE 5TH THROUGH 7TH STAGE OUTER SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED, MACHINED, AND IDENTIFIED AS A MATCHED SET. MAKE SURE THAT ALL SHROUD

SEGMENTS HAVE THE SAME MATING NUMBER AS THE HPC FRONT CASE IN WHICH THEY WERE MACHINED.

CAUTION: (POST SB PW4ENG 72-485) NEW OR REPAIRED 5TH STAGE SHROUD SET MUST BE ASSEMBLED AND FINISH MACHINED (TO PROVIDE A TRENCH IN THE SHROUD RUBSTRIPS). MAKE SURE THAT THE SHROUD SET HAS A TRENCH MACHINED INTO THE RUBSTRIP.

CAUTION: FELTMETAL RUBSTRIPS MUST NOT BE EXPOSED TO ANY LUBRICANT PRIOR TO ENGINE INSTALLATION.

(50) Put the HPC Stage 5 shroud set into the HPC front case.

NOTE: Engines incorporating 5th stage HPC blades and a shroud set featuring and increased diameter flowpath and a pretrench for improved blade tip to shroud/outer airseal clearance (Post SB PW4ENG 72-215) must use 5th stage shroud set PN 53H555-01.

(a) Apply Antigalling Compound P06-021 to the 5th stage HPC shroud set in the areas shown in Figure 1002.

(b) The shroud-set segment connecting Ends AA and DD must locate as shown. See Figure 1001 (Sheet 6).

VARIABLE STATOR VANE AND HPC FRONT CASE ASSEMBLY - ASSEMBLY-01

Task 72-35-02-440-002:

1. (For The Asymmetric (HPC) Case Configuration) Assemble The Variable Stator Vane And HPC Front Case Assembly

A. Equipment And Materials Required

Special Tools:

R	PWA 87888	Gage, Go (Variable Vane Arm) (Pre SB PW4ENG 72-743)
R	PWA 102728	Gage, Go (Variable Vane Arm) (Post SB PW4ENG 72-743)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P06-021	Antigalling Compound (PWA 550-3)
P06-041	Lubricant, Dry Film (PWA 36221)
P06-054	Paste, Antiseize (PWA 36246)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Bearing-Washer	74	72-35-00/12A/80
Bearing-Washer	49	72-35-00/13A/80
Bearing-Washer	45	72-35-00/14A/80
Bearing-Washer	61	72-35-00/15A/80
Key Washer	74	72-35-00/12A/300
Key Washer	49	72-35-00/13A/230
Key Washer	45	72-35-00/14A/220
Key Washer	61	72-35-00/15A/220
Packing	74	72-35-00/12A/90
Packing	49	72-35-00/13A/90
Packing	45	72-35-00/14A/90
Packing	61	72-35-00/15A/90

B. Procedure

CAUTION: THE 5TH THROUGH 7TH STAGE OUTER SHROUD SETS AND HPC FRONT CASE SET WERE ASSEMBLED, MACHINED, AND IDENTIFIED AS A MATCHED SET. MAKE SURE THAT BOTH HALVES OF THE HPC FRONT CASE HAVE THE SAME MATING NUMBER.

(1) Place both halves of the HPC front case assembly, large OD down, on a work bench.

(2) Install the HPC inlet vanes to the HPC front case as follows: See Figure 1001 (Sheet 1) or Figure 1001 (Sheet 2) as applicable.

(a) Install the thrust bearing washer (1001/2) on each HPC inlet vane trunnion at the grooved end. See Figure 1001 (Sheet 3).

(b) Install a new packing (1001/1) on each vane trunnion to seat in the groove.

(c) Make sure that the packing (1001/1) is correctly installed and is not twisted.

(d) Apply Dry Film Lubricant P06-041 to area of the packing (1001/1) as shown in the referenced figure.

(e) In the following steps, insert the vane, thickest part of airfoil down, through the lowest set of bearings in HPC front case.

(f) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the ten special IGV stage vanes that will have inner shroud keys installed at the locations specified.

1 Stand so you look at the ID of either case segment.

2 Install the special vanes so the thickest part of airfoil, leading edge, is down.

3 For the upper HPC front case half, insert the vane shaft, with the thrust washer and packing installed, into holes 2, 4, 20, 35, and 37. Start the count of holes from the split line and from left to right.

4 For the lower HPC front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 4, 19, 33, and 35. Start the count of holes from the split line and from left to right.

5 Complete the installation of remaining HPC inlet vanes, with packings and washers, until a total of 74 vanes are installed in both halves of the HPC front case assembly.

(g) (For the UPS configuration) Install the IGV stage vanes.

1 Stand so you look at the ID of either case segment.

2 Install the vanes so the thickest part of airfoil, leading edge, is down.

3 Install the inlet vanes, with packings and washers, until a total of 74 vanes are installed in both halves of the HPC front case assembly.

(3) Procedure to measure the distance between the sleeve bearings and the inner shroud.

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the shroud as follows: See Figure 1001 (Sheet 4).

NOTE: The following sleeve bearing height check is not required if you install new sleeve bearings.

1 Temporarily assemble the shroud set. Make sure the part numbers agree with the mating parts.

2 Install each sleeve bearing into the mating holes in the shroud set.

3 Measure the distance between the sleeve bearings and the shroud. The sleeve bearing height must be in the limits specified in the referenced figure.

4 Remove the bearings from the shroud set.

5 Disassemble the shroud set.

(4) (For Post SB PW4ENG 72-743 except the UPS Configuration) Install the IGV stage shroud to the IGV stage vanes as follows:

(a) Install ten special sleeve bearings that have key slots (1001/4) on the inner trunnions of the IGV vanes that have mating key slots. See Figure 1001 (Sheet 3).

NOTE: If you do not install new sleeve bearings, you must measure the distance between the sleeve bearings and the shroud as specified above.

(b) Install sleeve bearings without key slots (1001/5) on the inner trunnions of the other 64 IGV vanes.

NOTE: If you do not install new sleeve bearings, you must measure the distance between the sleeve bearings and the shroud as specified above.

(c) Place the shroud segment assemblies on a work bench.

(d) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(e) Separate the upper segment details from the lower details and place on a work bench with the mating face up.

(f) With the lower shroud details mating face up on the work bench, put the five keys (curved edges down) to fit the contour on the slots in the shroud. The flat edge will be flush with the face of the shroud. See Figure 1001 (Sheet 5).

NOTE: At the two key slots at each end of the segments, the flat of the key must go toward the bolt hole.

(g) Make sure that there are five keys in each shroud segment.

(h) Make sure that there are 74 bearing sleeves present on the ID end of the vane trunnions.

(i) Check for the correct sleeve bearing installation as follows:

1 For the upper front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 4, 20, 35, and 37 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

2 For the lower front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 4, 19, 33, and 35 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

(j) Apply Engine Oil P03-001 to the 18 bolts you will use to install the shroud set.

(k) Mating cut-outs in the upper shroud detail (detail with larger OD) with the installed bearing sleeves, install the shroud to the upper side of the vane bearing sleeves for each case half.

(l) Mating cut-outs, keys with slots in the bearing sleeves, and dowel pins with the dowel holes, install the lower shroud (detail without the guide assembly support) to the lower side of the vane bearing sleeves for each case half.

(m) Install both shroud halves with 18 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(n) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(o) Complete the installation of the shroud on both halves of the HPC front case assembly.

(p) Check for vane freedom of movement of the special vanes as follows:

1 For the upper front case half, count the vanes from left to right. Check the vanes at the Locations 2, 4, 20, 35, and 37 for freedom of movement.

2 For the lower front case half, count the vanes from left to right. Check the vanes at the Locations 2, 4, 19, 33, and 35 for freedom of movement.

3 If any vane does not move freely, disassemble the shroud and check the bearing for damage.

(5) (For the UPS configuration) Install the IGV stage shroud to the IGV stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install sleeve bearings (1001/5) on the inner trunnions of the 74, IGV stage vanes. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Place the shroud segment assemblies on a work bench.

(d) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(e) Make sure that there are 74 bearing sleeves present on the ID end of the vane trunnions.

(f) Apply Engine Oil P03-001 to the 18 bolts you will use to install the shroud set.

(g) Install the IGV stage shroud on IGV stage vanes so that shroud half with the larger OD is positioned above the bearings and other half of the shroud is below the bearings.

(h) Install both shroud halves with 18 lubricated bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(i) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(j) Complete the installation of the shroud on both halves of the HPC front case assembly.

(6) Install the 5th stage vanes to the HPC front case as follows: See Figure 1001 (Sheet 1) or Figure 1001 (Sheet 2) as applicable.

  (a) Install the thrust washer (1001/2) on each 5th stage vane trunnion at the grooved end. See Figure 1001 (Sheet 3).

  (b) Install a new packing (1001/1) on each vane trunnion to seat in the groove.

  (c) Make sure that the packing (1001/1) is correctly installed and is not twisted.

  (d) Apply Dry Film Lubricant P06-041 to area of the packing (1001/1) as shown in the referenced figure.

  (e) In the following steps, insert the vane, thickest part of airfoil down, through the set of bearings immediately above previously installed IGV stage vanes in HPC front case.

  (f) (For Post SB PW4ENG 72-743 except the UPS) Install the ten 5th stage vanes that will have inner shroud keys installed at the locations specified.

    1 Stand so you look at the ID of either case segment.

    2 Install these special vanes so the thickest part of airfoil, leading edge, is down.

    3 For the upper front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 13, 22 and 23. Start the count of holes from the split line and from left to right.

    4 For the lower front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 13, 23, and 24. Start the count of holes from the split line and from left to right.

    5 Complete the installation of remaining 5th stage vanes, with packings and washers, until a total of 49 vanes are installed in both halves of the HPC front case assembly.

(g) (For the UPS configuration) Install the 5th stage vanes as follows:

1 Stand so you look at the ID of either case segment.

2 Install the vanes so the thickest part of airfoil, leading edge, is down.

3 Install the 5th stage vanes, with packings and washers, until a total of 49 vanes are installed in both halves of the HPC front case assembly.

(7) (For Post SB PW4ENG 72-743 except the UPS Configuration) Install the 5th stage shroud to the 5th stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install ten special sleeve bearings that have key slots (1001/4) on the inner trunnions of the 5th stage vanes that have mating key slots. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Install sleeve bearings without key slots (1001/5) on the inner trunnions of the other 39, 5th stage vanes.

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(d) Place the shroud segment assemblies on a work bench.

(e) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(f) Separate the upper segment details from the lower details and place on a work bench with the mating face up.

(g) With the lower shroud details mating face up on the work bench, put the five keys (curved edges down) to fit the contour on the slots in the shroud. The flat edge will be flush with the face of the shroud. See Figure 1001 (Sheet 5).

(h) Make sure that there are five keys in each shroud segment.

(i) Make sure that there are 49 bearing sleeves present on the ID end of the vane trunnions.

(j) Check for the correct sleeve bearing installation as follows:

1 For the upper front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 13, 22, and 23 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

2 For the lower front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 13, 23, and 24 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

(k) Apply Engine Oil P03-001 to the 16 bolts you will use to install the shroud set.

(l) Mating cut-outs in the upper shroud detail (detail with the larger OD) with the installed bearing sleeves, install the shroud to the upper side of the vane bearing sleeves for each case half.

(m) Mating cut-outs, keys with slots in the bearing sleeves, and dowel pins with the dowel holes, install the lower shroud to the lower side of the vane bearing sleeves for each case half.

(n) Install both shroud halves with 16 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(o) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(p) Complete the installation of the shroud on both halves of the HPC front case assembly.

(q) Check for vane freedom of movement of the special vanes as follows:

1 For the upper front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 13, 22, and 23 for freedom of movement.

2 For the lower front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 13, 23, and 24 for freedom of movement.

3 If any vane does not move freely, disassemble the shroud and check the bearing for damage.

(8) (For the UPS configuration) Install the 5th stage shroud to the 5th stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install sleeve bearings (1001/5) on the inner trunnions of the 49, 5th stage vanes. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Place the shroud segment assemblies on a work bench.

(d) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(e) Make sure that there are 49 bearing sleeves present on the ID end of the vane trunnions.

(f) Apply Engine Oil P03-001 to the 16 bolts you will use to install the shroud set.

(g) Install the 5th stage shroud on 5th stage vanes so that shroud half with larger OD is positioned above the bearings and other half of the shroud is below the bearings.

(h) Install both shroud halves with 16 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(i) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(j) Complete the installation of the shroud on both halves of the HPC front case assembly.

(9) Install the 6th stage vanes to the HPC front case as follows: See Figure 1001 (Sheet 1) or Figure 1001 (Sheet 2) as applicable.

(a) Install the thrust washer (1001/2) on the 6th stage vane trunnion at the grooved end. See Figure 1001 (Sheet 3).

(b) Install a new packing (1001/1) on each vane trunnion to seat in the groove.

(c) Make sure that the packing is correctly installed and is not twisted.

(d) Apply Dry Film Lubricant P06-041 to area of the packing (1001/1) as shown in the referenced figure.

(e) In the following steps, insert the vanes, thickest part of airfoil down, through the set of bearings immediately above the previously installed 5th stage vanes in HPC front case.

(f) (For Post SB PW4ENG 72-743 except the UPS) Install the ten 6th stage vanes that will have inner shroud keys installed at the locations specified.

1 Stand so you look at the ID of either case segment.

2 Install these special vanes so the thickest part of airfoil, leading edge, is down.

3 For the upper HPC front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 12, 21 and 22. Start the count of holes from the split line and from left to right.

4 For the lower HPC front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 11, 20, and 21. Start the count of holes from the split line and from left to right.

5 Complete the installation of remaining 6th stage vanes, with packings and washers, until a total of 45 vanes are installed in both halves of the HPC front case assembly.

(g) (For the UPS configuration) Install the 6th stage vanes.

1 Stand so you look at the ID of either case segment.

2 Install the vanes so the thickest part of airfoil, leading edge, is down.

3 Install the 6th stage vanes, with packings and washers, until a total of 45 vanes are installed in both halves of the HPC front case assembly.

(10) (For Post SB PW4ENG 72-743 except the UPS Configuration) Install the 6th stage shroud to the 6th stage vanes.

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install ten special sleeve bearings that have key slots (1001/4) on the inner trunnions of the 6th stage vanes that have mating key slots. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Install sleeve bearings without key slots (1001/5) on the inner trunnions of the other 35, 6th stage vanes.

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(d) Place the shroud segment assemblies on a work bench.

(e) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(f) Separate the upper segment details from the lower details and place on a work bench with the mating face up.

(g) With the lower shroud details mating face up on the work bench, put the five keys (curved edges down) to fit the contour on the slots in the shroud. The flat edge will be flush with the face of the shroud. See Figure 1001 (Sheet 5).

(h) Make sure that there are five keys in each shroud segment.

(i) Make sure that there are 45 bearing sleeves present on the ID end of the vane trunnions.

(j) Check for the correct sleeve bearing installation as follows:

1 For the upper front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 12, 21, and 22 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

2 For the lower front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 11, 20, and 21 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

(k) Apply Engine Oil P03-001 to the 16 bolts you will use to install the shroud set.

(l) Mating cut-outs in the upper shroud detail (detail with the larger OD) with the installed bearing sleeves, install the shroud to the upper side of the vane bearing sleeves for each case half.

(m) Mating cut-outs, keys with slots in the bearing sleeves, and dowel pins with the dowel holes, install the lower shroud with the keys to the lower side of the vane bearing sleeves for each case half.

(n) Install both shroud halves with 16 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(o) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(p) Complete installation of the shroud on both halves of the HPC front case assembly.

(q) Check for vane freedom of movement of the 6th stage special vanes as follows:

1 For the upper front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 12, 21, and 22 for freedom of movement.

2 For the lower front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 11, 20, and 21 for freedom of movement.

3 If any vane does not move freely, disassemble the shroud and check the bearing for damage.

(11) (For the UPS configuration) Install the 6th stage shroud to the 6th stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install sleeve bearings (1001/5) on the inner trunnions of the 45, 6th stage vanes. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Place the shroud segment assemblies on a work bench.

(d) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(e) Make sure that there are 45 bearing sleeves present on the ID end of the vane trunnions.

(f) Apply Engine Oil P03-001 to the 16 bolts you will use to install the shroud set.

(g) Install the 6th stage shroud on 6th stage vanes so that shroud half with the larger OD is positioned above the bearings and other half of the shroud is below the bearings.

(h) Install both shroud halves with 16 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(i) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(j) Complete installation of the shroud on both halves of the HPC front case assembly.

(12) Install the 7th stage vanes to the HPC front case as follows: See Figure 1001 (Sheet 1) or Figure 1001 (Sheet 2) as applicable.

(a) Install the thrust washer (1001/2) on the 7th stage vane trunnion at the grooved end. See Figure 1001 (Sheet 3).

(b) Install a new packing (1001/1) on each vane trunnion to seat in the groove.

(c) Make sure that the packing is correctly installed and is not twisted.

(d) Apply Dry Film Lubricant P06-041 to area of the packing (1001/1) as shown in the referenced figure.

(e) In the following steps, insert the vanes, thickest part of airfoil down, through upper set of bearings in ID of the HPC front case.

(f) (For Post SB PW4ENG 72-743 except the UPS) Install the ten 7th stage vanes that will have inner shroud keys installed at the locations specified.

1 Stand so you look at the ID of either case segment.

2 Install these special vanes so the thickest part of airfoil, leading edge, is down.

3 For the upper front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 16, 28 and 29. Start the count of holes from the split line and from left to right.

4 For the lower front case half, insert the shaft, with the thrust washer and packing installed, into holes 2, 3, 16, 29 and 30. Start the count of holes from the split line and from left to right.

5 Complete installation of remaining 7th stage vanes, with packings and washers, until a total of 61 vanes are installed in both halves of the HPC front case assembly.

(g) (For the UPS configuration) Install the 7th stage vanes as follows:

1 Stand so you look at the ID of either case segment.

2 Install the vanes so the thickest part of airfoil, leading edge, is down.

3 Install the 7th stage vanes, with packings and washers, until a total of 61 vanes are installed in both halves of the HPC front case assembly.

(13) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the 7th stage shroud to the 7th stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install ten special sleeve bearings that have key slots (1001/4) on the inner trunnions of the 7th stage vanes that have mating key slots. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Install sleeve bearings without key slots (1001/5) on the inner trunnions of the other 51, 7th stage vanes.

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(d) Place the shroud segment assemblies on a work bench.

(e) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(f) Separate the upper segment details from the lower details and place on a work bench with the mating face up.

(g) With the lower shroud details mating face up on the work bench, put ten keys (curved edges down) to fit the contour on the slots in the shroud. The flat edge will be flush with the face of the shroud. See Figure 1001 (Sheet 5).

(h) Make sure that there are five keys in each shroud segment.

(i) Make sure that there are 61 bearing sleeves present on the ID end of the vane trunnions.

(j) Check for the correct sleeve bearing installation as follows:

1 For the upper front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 16, 28, and 29 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

2 For the lower front case half, count the vanes from left to right. Make sure that the vanes at Locations 2, 3, 16, 29, and 30 have sleeves installed that are slotted, with the slotted ends of the sleeves positioned inward (toward the center of the case segment) and downward.

(k) Apply Engine Oil P03-001 to the 18 bolts you will use to install the shroud set.

(l) Mating cut-outs in the upper shroud detail (detail with the larger OD) with the installed bearing sleeves, install the shroud to the upper side of the vane bearing sleeves for each case half.

(m) Mating cut-outs, keys with slots in the bearing sleeves, and dowel pins with the dowel holes, install the lower shroud with the keys to the lower side of the vane bearing sleeves for each case half.

(n) Install both shroud halves with 18 bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(o) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(p) Complete installation of the shroud on both halves of the HPC front case assembly.

(q) Check for vane freedom of movement of the 7th stage special vanes as follows:

1 For the upper front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 16, 28, and 29 for freedom of movement.

2 For the lower front case half, count the vanes from left to right. Check the vanes at the Locations 2, 3, 16, 29, and 30 for freedom of movement.

3 If any vane does not move freely, disassemble the shroud and check the bearing for damage.

(14) (For the UPS configuration) Install the 7th stage shroud to the 7th stage vanes as follows:

(a) If you do not install new sleeve bearings in the following steps, you must measure the distance between the sleeve bearings and the specified in a preceding step. See Figure 1001 (Sheet 4).

(b) Install sleeve bearings (1001/5) on the inner trunnions of the 61, 7th stage vanes. See Figure 1001 (Sheet 3).

NOTE: The sleeve bearing height check is not required if you install new sleeve bearings.

(c) Place the shroud segment assemblies on a work bench.

(d) Locate the mating number at the approximate center of the upper and lower surface of the outer ring and make sure that the mating number is the same on both ring details for each shroud assembly.

(e) Make sure that there are 61 bearing sleeves present on the ID end of the vane trunnions.

(f) Apply Engine Oil P03-001 to the 16 bolts you will use to install the shroud set.

(g) Install the 7th stage shroud on 7th stage vanes so that shroud half with the larger OD is positioned above the bearings and other half of the shroud is below the bearings.

(h) Install both shroud halves with 16 lubricated bolts (heads up) and nuts. See Figure 1001 (Sheet 8).

(i) Torque the nuts to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(j) Complete installation of the shroud on both halves of the HPC front case assembly.

(15) Install the HPC shroud guide assemblies on each stage as shown in Figure 1001 (Sheet 8) and (Sheet 9).

CAUTION: THE 6TH STAGE BORESCOPE PLUG AND KEY WASHER CONFIGURATION (POST SB PW4ENG 72-326 AND/OR SB PW4ENG 72-468 AND/OR SB PW4ENG 72-518) CAN BE USED IN CASES INCORPORATING STANDARD SELF-HELICAL INSERTS OR IN CASES INCORPORATING LOCKING HELICAL INSERTS.

(16) Install the 6th the stage borescope plug. See Figure 1001 (Sheet 10).

(a) (Reference 1552) (Post SB PW4ENG 72-326 and/or SB PW4ENG 72-468 and/or SB PW4ENG 72-518) For the HPC front case incorporating self-locking or standard helical coil inserts in 6th the stage borescope port, remove excess baked on compound from the borescope plug threads using nylon brush.

(b) Apply Antiseize Paste P06-054 to threads and washer face of plug.

(c) Wipe off unwanted paste. Do not use Engine Oil P03-001.

(d) Install the plug and key washer to the "lower" case, to rear of the 6th stage vanes.

(e) Torque the plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

(f) Bend the tabs to safety the plug. See Standard Practices Manual, PN 585005, 70-53.

CAUTION: THE 5TH STAGE BORESCOPE PLUG AND KEY WASHER CONFIGURATION (POST SB PW4ENG 72-326 AND/OR SB PW4ENG 72-468 AND/OR SB PW4ENG 72-518) CAN BE USED IN CASES INCORPORATING STANDARD SELF-HELICAL INSERTS OR IN CASES INCORPORATING LOCKING HELICAL INSERTS.

(17) Install the 5th the stage borescope plug. See Figure 1001 (Sheet 10).

(a) (Reference 1554) (Post SB PW4ENG 72-326 and/or SB PW4ENG 72-468 and/or SB PW4ENG 72-518) For the HPC front case incorporating self-locking or standard helical coil inserts in the 5th stage borescope port, use a nylon brush to remove excess baked on compound from the borescope plug threads.

(b) Apply Antiseize Paste P06-054 to threads and washer face of plug.

(c) Wipe off unwanted paste. Do not use Engine Oil P03-001.

(d) Install the plug and key washer to the "lower" case, to rear of the 5th stage vanes.

(e) Torque the plug to 175 - 190 lb-in. (19.8 - 21.5 N.m).

(f) Bend the tabs to safety the plug. Refer to Standard Practices Manual, PN 585005, 70-53.

(18) Install the synchronizing ring runners. See Figure 1001 (Sheet 11).

(a) Install the synchronizing ring runners (without shims) to the IGV, 5th, 6th, and 7th stage synchronizing rings.

(b) Apply Engine Oil P03-001 to the bolts you will use to install the runners.

(c) Attach each runner with two lubricated bolts and key washers.

(d) Tighten the bolts fingertight.

(19) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the inlet guide vane synchronizing ring assembly as follows:

(a) Install stepped spacers onto the ends of the special vanes as follows:

1 In the following steps the locations are numbered as viewed from the OD of the specified case segment. Start the count of holes from the split line and from right to left.

2 For the upper HPC front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 4, 20, 35, and 37.

3 For the lower HPC front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 4, 19, 33, and 35.

CAUTION: BE SURE THAT THE LEADING EDGE OF THE VANES ARE POINTED DOWN. VANES THAT ARE POINTED 180 DEGREES IN THE WRONG DIRECTION WILL CAUSE VIBRATIONS IN THE HPC AND CAN CAUSE COMPRESSOR BLADE FRACTURE.

(b) Make sure that the leading edge of all vanes are installed with the leading edge pointed down.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF THE VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(c) Install inlet guide vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed.

(d) Align the offset edges of the vane arms with the offset slots in the vane shafts.

(e) Tap lightly until holes in vane arms line up with holes in vane trunnions.

(f) Following assembly of the vane arms onto the vane trunnions, check the outside width of the vane arm
R claws with PWA 87888 Gage (Pre SB PW4ENG 72-743),
R or PWA 102728 Gage (Post SB PW4ENG 72-743) to make sure there is no deformation of the claw and that vane arm has been assembled correctly to the vane trunnion. See Figure 1001 (Sheet 13).

(g) Apply Engine Oil P03-001 to the 74 bolts you will use to attach the vane arms to the vanes.

(h) Temporarily attach the vane arms to the vane trunnions with washers and lubricated work bolts.

(i) Tighten and torque the work bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(j) Repeat the above steps for other case half.

(k) Remove the work bolts and washers from the special IGV stage vanes and install 74 lubricated bolts (1001/1), flat washers (1001/3), and key washers (1001/2) to attach the arms to the vanes. See Figure 1001 (Sheet 12).

(l) Tighten and torque the bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(m) Bend the tabs of the washers to safety the bolts.

(20) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the Stage 5 vane synchronizing ring assembly as follows:

(a) Install stepped spacers onto the ends of the special vanes as follows:

1 In the following steps the locations are numbered as viewed from the OD of the specified case segment. Start the count of holes from the split line and from right to left.

2 For the upper front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 13, 22 and 23.

3 For the lower front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 13, 23, and 24.

CAUTION: BE SURE THAT THE LEADING EDGE OF THE VANES ARE POINTED DOWN. VANES THAT ARE POINTED 180 DEGREES IN THE WRONG DIRECTION WILL CAUSE VIBRATIONS IN THE HPC AND CAN CAUSE COMPRESSOR BLADE FRACTURE.

(b) Make sure that the leading edge of all vanes are installed with the leading edge pointed down.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF THE VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(c) Install the Stage 5 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed.

(d) Align the offset edges of the vane arms with the offset slots in the vane shafts.

(e) Tap lightly until holes in vane arms line up with holes in vane trunnions.

(f) Following assembly of the vane arms onto the vane trunnions, check the outside width of the vane arm
R claws with PWA 87888 Gage (Pre SB PW4ENG 72-743),
R or PWA 102728 Gage (Post SB PW4ENG 72-743) to make
sure there is no deformation of the claw and that vane arm has been assembled correctly to the vane trunnion. See Figure 1001 (Sheet 13).

(g) Apply Engine Oil P03-001 to the 49 bolts you will use to attach the vane arms to the vanes.

(h) Temporarily attach the vane arms to the vane trunnions with washers and lubricated work bolts.

(i) Tighten and torque the work bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(j) Repeat the above steps for other case half.

(k) Remove the work bolts and washers from the special 5th stage vanes and install 49 lubricated bolts (1001/1), flat washers (1001/3), and key washers (1001/2) to attach the arms to the vanes. See Figure 1001 (Sheet 12).

(l) (Reference 1551) Tighten and torque the bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m). Bend the tabs of the washers to safety the bolts.

(m) Bend the tabs of the washers to safety the bolts.

(21) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the Stage 6 vane synchronizing ring assembly.

(a) Install stepped spacers onto the ends of the special vanes as follows:

1 In the following steps the locations are numbered as viewed from the OD of the specified case segment. Start the count of holes from the split line and from right to left.

2 For the upper HPC front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 12, 21 and 22.

3 For the lower HPC front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 11, 20, and 21.

CAUTION: BE SURE THAT THE LEADING EDGE OF THE VANES ARE POINTED DOWN. VANES THAT ARE POINTED 180 DEGREES IN THE WRONG DIRECTION WILL CAUSE VIBRATIONS IN THE HPC AND CAN CAUSE COMPRESSOR BLADE FRACTURE.

(b) Make sure that the leading edge of all vanes are installed with the leading edge pointed down.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF THE VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(c) Install the Stage 6 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed.

(d) Align the offset edges of the vane arms with the offset slots in the vane shafts.

(e) Tap lightly until holes in vane arms line up with holes in vane trunnions.

(f) Following assembly of the vane arms onto the vane trunnions, check the outside width of the vane arm
R claws with PWA 87888 Gage (Pre SB PW4ENG 72-743)
R or PWA 102728 Gage (Post SB PW4ENG 72-743) to make sure there is no deformation of the claw and that vane arm has been assembled correctly to the vane trunnion. See Figure 1001 (Sheet 13).

(g) Apply Engine Oil P03-001 to the 45 bolts you will use to install the vanes arms to the vanes.

(h) Temporarily attach the vane arms to the vane trunnions with washers and lubricated work bolts.

(i) Tighten and torque the work bolts to 35 - 40 lb-in.(3.954 - 4.519 N.m).

(j) Repeat the above steps for other case half.

(k) Remove the work bolts and washers from the special 6th stage vanes and install 45 lubricated bolts (1001/1), flat washers (1001/3), and key washers (1001/2) to attach the arms to the vanes. See Figure 1001 (Sheet 12).

(l) (Reference 1551) Tighten and torque the 45 bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(m) Bend the tabs of the washers to safety the bolts.

(22) (For Post SB PW4ENG 72-743 except the UPS configuration) Install the Stage 7 vane synchronizing ring assembly as follows:

(a) Install stepped spacers onto the ends of the special vanes as follows:

1 In the following steps the locations are numbered as viewed from the OD of the specified case segment. Start the count of holes from the split line and from right to left.

2 For the upper front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 16, 28 and 29.

3 For the lower front case half, install stepped spacers onto the ends of the special vanes at Locations 2, 3, 16, 29 and 30.

CAUTION: BE SURE THAT THE LEADING EDGE OF THE VANES ARE POINTED DOWN. VANES THAT ARE POINTED 180 DEGREES IN THE WRONG DIRECTION WILL CAUSE VIBRATIONS IN THE HPC AND CAN CAUSE COMPRESSOR BLADE FRACTURE.

(b) Make sure that the leading edge of all vanes are installed with the leading edge pointed down.

CAUTION: FAILURE TO CORRECTLY ALIGN THE OFFSET EDGES OF THE VANE ARM CLAW WITH THE OFFSET SLOTS IN THE VANE TRUNNIONS DURING ASSEMBLY WILL ORIENT THE VANE UP TO 180 DEGREES OUT OF POSITION, WHICH WILL PRODUCE SEVERE VIBRATORY EXCITATION IN THE HPC AND CAN LEAD TO COMPRESSOR BLADE FRACTURE.

(c) Install the Stage 7 vane synchronizing ring assembly (vane arms downward) to the five special vanes that have stepped spacers installed.

(d) Align the offset edges of the vane arms with the offset slots in the vane shafts.

(e) Tap lightly until holes in vane arms line up with holes in vane trunnions.

(f) Following assembly of the vane arms onto the vane trunnions, check the outside width of the vane arm
R claws with PWA 87888 Gage (Pre SB PW4ENG 72-743)
R or PWA 102728 Gage (Post SB PW4ENG 72-743) to make sure there is no deformation of the claw and that vane arm has been assembled correctly to the vane trunnion. See Figure 1001 (Sheet 13).

(g) Apply Engine Oil P03-001 to the 61 bolts (1001/1) you will use to attach the vane arms to the vanes. See Figure 1001 (Sheet 12).

(h) Temporarily attach the vane arms to the vane trunnions with washers and lubricated work bolts.

(i) Tighten and torque the work bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(j) Repeat the above steps for other case half.

(k) Remove the work bolts and washers from the special 7th stage vanes and install 61 lubricated bolts (1001/1), flat washers (1001/3), and key washers (1001/2) to attach the arms to the vanes. See Figure 1001 (Sheet 12).

(l) (Reference 1551) Tighten and torque the 61 bolts (1001/1) to 35 - 40 lb-in. (3.954 - 4.519 N.m).

(m) Bend the tabs of the key washers to safety bolts.

(23) (For the UPS configuration) Install the IGV, 5th, 6th, and 7th stage vane synchronizing ring assemblies as follows:

NOTE: Do the steps that follow one stage at a time.

(a) Stand so you face the OD of either HPC front case half.

CAUTION: BE SURE THAT THE LEADING EDGE OF THE VANES ARE POINTED DOWN. VANES THAT ARE POINTED 180 DEGREES IN THE WRONG DIRECTION WILL CAUSE VIBRATIONS IN THE HPC AND CAN CAUSE COMPRESSOR BLADE FRACTURE.

(b) Make sure that the leading edge of all vanes are installed with the leading edge pointed down.

(c) Install the synchronizing ring assembly, vane arms pointed down.

1 Align the offset edge edges of the vane arms with the offset slots in the vane shafts.

2 Hit the ring assembly lightly until the holes in the vane arms line up with the holes in the vane shafts.

3 Following assembly of the vane arms onto the vane trunnions, check the outside width of
R the vane arm claws with PWA 87888 Gage (Pre
R SB PW4ENG 72-743) or PWA 102728 Gage (Post
R SB PW4ENG 72-743) to make sure there is no
deformation of the claw and that vane arm has been assembled correctly to the vane trunnion. See Figure 1001 (Sheet 13).

4 Apply Engine Oil P03-001 to the 229 bolts you will use to attach the vane arms to the vanes.

5 Install the flat washers, key washers, and lubricated bolts to hold the vane arms.

6 Do the above steps, again for the other case segment.

7 (Reference 1551) Tighten and torque bolts to 35 - 40 lb-in. (3.954 - 4.519 N.m).

8 Bend the tabs of the key washers to safety bolts.

(d) Move the vane arms by hand to be sure that they can move through a minimum angle of 5 degrees from their starting position (parallel to the engine axis), but not more than 20 degrees in either direction.

(e) Do the steps again to install the synchronizing rings on each stage.

CAUTION: FELTMETAL RUBSTRIPS MUST NOT BE EXPOSED TO ANY LUBRICANT PRIOR TO ENGINE INSTALLATION.

(24) If they are not there, install the HPC Stage 5 through 7th stage shroud sets into the HPC front case as follows:

(a) Apply Antigalling Compound P06-021 to the HPC shroud set in the areas shown. Figure 1001 (Sheet 14).

(b) The shroud-set segment connecting Ends AA and DD must locate as shown. See Figure 1001 (Sheet 15).

CHAPTER 72

HIGH PRESSURE COMPRESSOR (HPC)

TABLE OF CONTENTS

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
HIGH PRESSURE COMPRESSOR (HPC)	72-35-00		
How To Use		001	ALL
Task 72-35-00-990-003: Chapter/Section/Subject Numbering Outline		001	
Description/Operation-00		001	ALL
Task 72-35-00-990-002: High Pressure Compressor (HPC)		001	
Disassembly-01		501	4152 4156A 4158
Task 72-35-00-030-001: Remove HPC External Parts		501	
Disassembly-01		501	4152-3 4156A-3 4158-3
Task 72-35-00-030-005: Remove HPC External Parts		501	
Disassembly-02		501	ALL
Task 72-35-00-030-002: Remove HPC Stator Vane Actuator And Lever Assembly		501	
Disassembly-03		501	CONFIG-1 4152 4152-3 4156A 4156A-3 4158 4158-3
Task 72-35-00-030-003: Disassemble High Pressure Compressor (HPC)		501	
Disassembly-03		501	CONFIG-2 4152 4152-3 4156A 4156A-3 4158 4158-3
Task 72-35-00-030-006: Disassemble The High Pressure Compressor (HPC) (Ring Case Configuration)		501	
Disassembly-04		501	ALL
Task 72-35-00-030-004: (Pre Ring Case Configuration) Disassemble Stator And Rear Case Pre-Assembly - High Pressure Compressor (HPC)		501	
Disassembly-05		501	CONFIG-1 4152 4152-3 4156A 4156A-3 4158 4158-3
Task 72-35-00-030-022: Disassemble The Compressor Stator (Vane) Assemblies		501	
Disassembly-20		501	ALL
Task 72-35-00-030-020: Remove The Flange J Brackets And Hardware		501	
Disassembly-21		501	ALL

SUBJECT	CHP/SEC/SUB	PAGE	EFFECTIVITY
HIGH PRESSURE COMPRESSOR (HPC) (CONTINUED)	72-35-00

HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY - DISASSEMBLY-01

Task 72-35-03-040-001:

1. Disassemble HPC Stator Vane Actuator And Lever Assembly

A. Equipment And Materials Necessary

Special Tools:
PWA 85688 Puller, Jackscrew
PWA 86322 Puller, HPC Lever Bearing

B. Procedure
See Figure 501, Figure 502, Figure 503, Figure 504, Figure 505 and Figure 506.

(1) Unbend tabs of washers and remove seals, rod end bearings, washers, nuts, and adjusters from rod end bearings on lever clevises. Discard key washers and seals.

(2) (Pre SB PW4ENG 72-506) Remove cotter pins, nuts, washers, and bolts securing rod end bearings to clevises. Discard cotter pins.

(3) (Post SB PW4ENG 72-506) Remove cotter pins, nuts, and bolts securing rod end bearings to clevises. Discard cotter pins.

(4) Remove cotter pin, nut, washer, and bolt securing actuator rod to stator lever. Discard cotter pin.

(5) Remove cotter pins, nuts, spacers, and bolts retaining actuator bearings in support. Discard cotter pins.

(6) Install PWA 85688 Puller to pins in actuator and remove pins. Remove bearings and actuator from support.

(7) Remove seal and unbend tabs of washer on actuator rod. Remove rod end bearing washer and nut from actuator rod. Remove adapters from actuator. Discard key washer and packings.

(8) Unbend tab of key washer and remove bolt and washer securing 7th stage lever (506/2) to lever (506/5). Remove lever and discard key washer.

(9) Remove cotter pin, nut, and bolt securing inlet lever (506/6) to lever (506/5). Remove inlet lever with bearing. Remove bearing (506/4) from inlet lever (506/6). Discard cotter pin.

(10) Remove bearing (506/4) from support (506/1) and lever (506/5).

  (a) Remove snap ring (506/3) from support (506/1).

  (b) Install PWA 86322 Puller detail−2 inboard of support (506/1) and against lever (506/5) at the 6th stage location. Ensure the puller is in contact with the bearing (506/4) and that the threaded hole, in puller, is aligned with the axial hole in the lever (506/5).

  (c) Insert PWA 86322 Screw detail−1 through lever (506/5) and into detail−2 puller.

  (d) Turn screw to push bearing from the lever (506/5).

  (e) Remove lever (506/5) from support (506/1).

HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY - ASSEMBLY-01

Task 72-35-03-440-001:

1. Assemble HPC Stator Vane Actuator And Lever Assembly

A. Equipment And Materials Required

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

PWA 86141	Indicator, Stretch
PWA 88742	Drift

Consumable Materials:

	Item No.	Designation
	P03-001	Oil, Engine (PWA 521B)
	P05-289	Lockwire (AS3214-02)
	P05-291	Cable, Safety (Optional)
R	P05-292	Ferrule, Safety Cable (Optional)
	P06-005	Lubricant (PWA 587)
	P06-021	Compound, Antigalling (PWA 550-3)
	P06-037	Compound, Anti-seize (PWA 36053-4)
R	P06-053	Lubricant, Sealing Ring (PWA 36500)

Expendable Parts:

HPC STATOR VANE ACTUATOR AND LEVER ASSEMBLY - ASSEMBLY-01

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
(CONTINUED)		
Seal	1	72-35-00/27/50
Seal	1	72-35-00/28/50

B. Procedure
See Figures 1001 thru Figure 1006.

(1) Place compressor stator cylinder support assembly (1001/1) on bench with the four attaching support legs down.

(2) Install a bearing (1001/4) on HPC inlet lever (1001/6) as follows.

(a) Chill the inlet lever (1001/6) and bolt for approximately ten minutes.

(b) Put the HPC inlet lever (1001/6) hollow end up on a standard arbor press.

(c) Put the bearing (1001/4) (part number side down) over the HPC inlet lever (1001/6).

(d) Put the PWA 88742 Drift over the bearing and press the bearing so that it touches the shoulder on the lever assembly.

(3) Position HPC 5th and 6th stage lever assembly (1001/5) to support assembly (1001/1).

(4) Install bearing (1001/4) to lever assembly (1001/5) and support assembly (1001/6) in opening having provision for a snap ring. Push bearing to seat against lever shoulder. Retain bearing with a snap ring (1001/3).

(5) Install HPC inlet lever (1001/6) to HPC 5th and 6th stage lever assembly. Align holes in lever and lever assembly and secure with bolt, threads lubricated with Engine Oil P03-001 and nut. Tighten and torque nut to 65 - 85 lb-in. (7.344 - 9.604 N.m) to align slot and bolt hole for cotter pin installation. Install cotter pin and bend tangs around nut. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

R
R

(6) (Reference 734) Position HPC 7th stage lever (1001/2) aligning teeth with HPC 5th and 6th stage lever assembly. Secure HPC 7th stage lever with bolt, threads lubricated with Antigalling Compound P06-021, and key washer. Tighten and torque bolt to 505 - 565 lb-in. (57.057 - 63.836 N.m). Bend tabs of washer to secure bolt. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolt head.

R R R (7) Install the new packings, lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 on the adapters. Remove the protective closures from the stator vane actuator ports and install adapters, threads lubricated with Engine Oil P03-001. Torque adapter or return port to 110 - 120 lb-in. (12.428 - 13.558 N.m). Torque adapter on pressure port to 150 - 170 lb-in. (16.948 - 19.207 N.m).

(8) Install nut, key washer and rod end bearing to actuator rod. Do not tighten nut or bend tab of key washer.

(9) Position actuator to support with rod end bearing through hole in support. Install bearings to support and align side mount holes with openings in support bearings. Apply Lubricant P06-005 or Anti-seize Compound P06-037 to the bearing pins and insert pins through support bracket bearings to engage the actuator. Tap to seat.

(10) Install bearing stops to support aligning bolt holes.

- (a) (Pre SB PW4ENG 72-498) Secure stops with bolts, threads lubricated with Engine Oil P03-001, and nuts.

- (b) (Post SB PW4ENG 72-498) Secure stops with bolts, threads lubricated with Engine Oil P03-001, washers and nuts. Install washers between the head of the bolts and the bearing housing of the support assembly.

(11) Tighten and torque nuts to 36 - 40 lb-in. (4.067 - 4.519 N.m). Install cotter pins to nuts and bend to secure.

(12) Temporarily install bolt, threads lubricated with Engine Oil P03-001, through lever and rod end bearing. Install washer and nut to bolt.

CAUTION: INLET, 5TH, 6TH AND 7TH STAGE SPACERS MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197).

(13) Install bolt, threads lubricated with Engine Oil P03-001, through lever and secure spacer and inlet clevis to lever with nut fingertight. See Figure 1003.

CAUTION: INLET, 5TH, 6TH AND 7TH STAGE SPACERS MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197).

(14) Install bolt, threads lubricated with Engine Oil P03-001, through fifth clevis and secure spacer and fifth clevis to lever with nut fingertight. See Figure 1004.

CAUTION: INLET, 5TH, 6TH AND 7TH STAGE SPACERS MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197).

(15) Install bolt, threads lubricated with Engine Oil P03-001, through sixth clevis and secure spacer and sixth clevis to lever with nut fingertight. See Figure 1005.

CAUTION: INLET, 5TH, 6TH AND 7TH STAGE SPACERS MUST BE USED IN SETS FOR SIX STATOR VANE SCHEDULE OR 19 STATOR VANE SCHEDULE (SB PW4ENG 72-197).

(16) Install bolt, threads lubricated with Engine Oil P03-001, through seventh clevis and secure spacer and seventh clevis to lever with nut fingertight. See Figure 1006.

(17) (Pre SB PW4ENG 72-506) Install rod end bearing to each installed clevis and secure with bolt, washer and nut.

(18) (Post SB PW4ENG 72-506) Install rod end bearing to each installed clevis and secure with bolt and nut.

(19) (Reference 730) Tighten nuts to 15 - 22 lb-in. (1.695 - 2.486 N.m) plus additional torque required to turn the bolt through the nut threads. Install cotter pins to secure nuts.

(20) (Reference 731 and 732) Stretch the bolts which attach the clevises and the spacers to the bellcrank as follows:

CAUTION: THE MAXIMUM STRETCH OF 0.006 INCH (0.152 MM) ON THE BOLT MUST NOT BE EXCEEDED. IF THE STRETCH IS EXCEEDED, THE BOLT MUST BE REMOVED AND DISCARDED AND REPLACED WITH A NEW BOLT.

(a) With the bolts installed hand tight, use a PWA 86141 Stretch Indicator and measure the length of the bolts (top of the bolt head to the end of the bolt shank) and record the length dimension for each stage on a piece of paper.

(b) Tighten the nut until the parts touch.

NOTE: An eighth of a turn of the nut will stretch the bolt approximately 0.0026 inch (0.066 mm).

(c) Tighten the nut in eighths (1/8) of a turn and measure the bolt length.

(d) Repeat this procedure until the bolt for each stage is stretched 0.005 − 0.006 inch (0.127 − 0.152 mm) longer than its first measurement previously recorded.

(21) Install the Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the nuts and seal.

(22) Install nuts and key washers to each rod end bearing. Install rod end bearing, nut and key washer to each adjuster. Install each adjuster to rod end bearing or stator lever. Do not tighten nuts at this time.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET - DISASSEMBLY-01

Task 72-35-04-040-001:

1. Disassemble The HPC Outer Air Seal Set, Stages 5 Through 15

A. Prerequisites

(1) Machine The HPC Outer Air Seal Set. Refer to 72-35-04, Assembly-02 (Task 72-35-04-440-002).

B. Equipment And Materials Necessary

Standard Tools:

Optional, Wrench (Extended Socket) Part No. QCL 5/16-2D-3/16 Used With Optional Cleco Air Gun	Brimatco Corporation P.O. Box 88 1486 Highland Ave. Cheshire, CT 06410 USA
Optional Cleco Air Gun (Nutrunner) PN 44RNAL-2-H-3, or PN 44RNAL-2RA8 Or Equivalent	Local Distributor Or, Cooper Tools Sales and Service P.O. Box 1410 Lexington, SC 29071-1410 USA
Optional, Flexible Extension Part No. GSYMU101 Or Equivalent	Snap-On Technologies Inc. P.O. Box 1430 Kenosha, WI 53141-1430 USA

NOTE: The optional Brimatco wrench (extended socket) PN QCL 5/16-2D-3/16 can be use with the Cleco Air Gun to help remove the flange nuts on the 8th through 14th stage compressor cases.

Special Tools:

	PWA 76154	Adapter (4 Necessary)
R	PWA 86536	Adapter, Torque (HPC Front Case Split Flange Nuts) (Optional To PWA 107300)
	PWA 88673	Sling, (2 Necessary)
	PWA 102260	Adapter, Torque (9th Through 14th Stage Compressor Case Flange Nuts)
	PWA 105504	Adapter, Lift
	PWA 105588	Puller, Jackscrew (3 Necessary) (8th Stage Compressor Case Removal)
	PWA 107299	Adapter, Breakaway (HPC Case Flange Nuts)

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − DISASSEMBLY−01

Special Tools:

(CONTINUED)

R	PWA 107300	Adapter, Breakaway (HPC Front Case Split Flange Nuts) (Optional To PWA 86536)

C. Procedure

NOTE: The detail parts of the HPC outer air seal set (Stages 5 through 15) were assembled and machined as a matched set. These parts are identified by the Letter M followed by the last five digits of the HPC rear case and must be kept together as a matched set.

Subtask 72−35−04−040−001:

(1) Trunnion the case set to the front end down position. See Figure 501.

(a) Use a hoist to connect the PWA 88673 Sling with two PWA 76154 Adapters to the PWA 105565 Fixture.

(b) Use the hoist to lift the case assembly.

(c) If necessary, remove and install the trunnion spools of PWA 100221 Machining Fixture in the REMOVE/INSTALL position.

(d) Use a second hoist to connect PWA 88673 Sling with two PWA 76154 Adapters to the PWA 100221 Machining Fixture.

(e) Use both hoists to trunnion the case assembly to the HPC front case end down position.

(f) Remove the lower Adapters, Sling, and hoist.

(g) Lower the assembly on a suitable support.

Subtask 72−35−04−040−002:

(2) Remove the PWA 100221 Machining Fixture. See Figure 501.

(a) Remove the 12 bolts (501/1), spacers (501/2), and nuts (501/3) that attach Fixture to the rear flange of the HPC rear case.

(b) Install four jackscrews into the rear flange of the HPC rear case.

(c) Turn the jackscrews evenly to loosen the Fixture from the case.

(d) Remove the jackscrews.

(e) Use the hoist to remove the Fixture.

(3) Remove the HPC rear support (502/3). See Figure 502.

(a) Remove the bolts (502/1) and washers (502/2) and nuts (502/5) and washers (502/6) that attach the HPC rear support (502/3) to the HPC rear case.

NOTE: You can use the PWA 107299 Adapter or the PWA 102260 Torque Adapter with a 3/8 inch drive to loosen the case flange nuts in the steps that follow.

(b) Remove the bolts (502/7), washers (502/8), nuts (502/5), and washers (502/6) that attach the HPC rear support (502/3) to the 15th stage air seal.

(c) Install 12 (.250-28) jackscrews in equally spaced threaded holes in the inner flange of the HPC rear support (502/3).

(d) Evenly tighten the jackscrews to remove the rear support (502/3) and the 15th stage air seal from the 14th stage case.

(e) Remove the jackscrews.

(f) Remove the HPC rear support (502/3) from the case.

(g) Remove the eight spacers (502/4).

(h) Use a suitable mallet to lightly tap the 15th stage air seal to remove it from the HPC rear support.

Subtask 72-35-04-040-003:

(4) Remove the HPC rear case (503/1). See Figure 503.

(a) Remove the bolts, washers, and nuts that attach the HPC rear case (503/1) to the rear flange of the HPC front case.

(b) Install four .250−28 jackscrews in the threaded holes in the front flange of the rear case (503/1).

(c) Evenly tighten the jackscrews to loosen the rear case. Remove the jackscrews.

(d) Attach a hoist to the lift hole in PWA 105504 Adapter.

(e) Use the hoist to lift the Adapter and put it over the HPC rear case (503/1).

(f) Align the boltholes in the Adapter with the boltholes in the case. Install the Adapter to the HPC rear case (503/1) with eight detail screw assemblies and four nut plates.

NOTE: The Adapter has a scribed line on the OD of the outer ring. Align this line with the offset hole in the rear flange of the HPC rear case. The offset hole is at the approximate 6 o'clock (180 degree) position.

(g) Use the hoist to remove the HPC rear case (503/1).

(h) Put the case on a pallet.

(i) Remove the screw assemblies and nut plates that attach the Adapter to the case.

(j) Remove the Adapter from the case.

Subtask 72−35−04−040−005:

(5) Remove The 14th stage compressor case assembly.

(a) Remove the nuts, bolts, and washers that attach the 14th stage case and air seal to the 13th stage compressor case.

(b) Install six .250−28 jackscrews in equally spaced threaded holes in the front flange of the 14th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and the 14th stage case.

(6) Remove the 14th stage compressor air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear flange of the 13th stage case.

(b) Evenly tighten the jackscrews to loosen the 14th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−006:

(7) Remove The 13th stage compressor case assembly.

(a) Remove the nuts, bolts, and washers that attach the 13th stage case and air seal to the 12th stage compressor case.

(b) Install six .250−28 jackscrews in equally spaced threaded holes in the front (lower) flange of the 13th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews and the 13th stage case.

(8) Remove the 13th stage compressor air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear (upper) flange of the 12th stage case.

(b) Evenly tighten the jackscrews to loosen the 13th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−007:

(9) Remove the 12th stage compressor case assembly.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − DISASSEMBLY−01

(a) Remove the nuts and bolts that attach the 12th stage case and air seal to the 11th stage case.

(b) Install six .250−28 jackscrews in equally spaced threaded holes in the front flange of the 12th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews.

(e) Remove the case.

(10) Remove the 12th stage compressor air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear (upper) flange of the 11th stage case.

(b) Evenly tighten the jackscrews to loosen the 12th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−008:

(11) Remove the 11th stage compressor case assembly.

(a) Use the PWA 102260 Torque Adapter with a 3/8 inch drive to loosen and remove the nuts that attach the 11th stage case and air seal to the 10th stage case.

(b) Remove the bolts. Remove the washers from the dowel bolts.

(c) Install six .250−28 jackscrews in equally spaced threaded holes in the front flange of the 11th stage case.

(d) Evenly tighten the jackscrews to loosen the case.

(e) Remove the jackscrews.

(f) Remove the case.

(12) Remove the 11th stage compressor air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear flange of the 10th stage case.

(b) Evenly tighten the jackscrews to loosen the 11th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−009:

(13) Remove the 10th stage compressor case assembly.

(a) Remove the nuts and bolts that attach the 10th stage case and air seal to the 9th stage case.

(b) Install six .250−28 jackscrews in equally spaced threaded holes in the front (lower) flange of the 10th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews.

(e) Remove the case.

(14) Remove the 10th compressor stage air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear flange of the 9th stage case.

(b) Evenly tighten the jackscrews to loosen the 10th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−010:

(15) Remove the 9th stage compressor case assembly.

(a) Remove the nuts and bolts that attach the 9th stage case and air seal to the 8th stage case.

(b) Install six .250−28 jackscrews in equally spaced threaded holes in the front (lower) flange of the 9th stage case.

(c) Evenly tighten the jackscrews to loosen the case.

(d) Remove the jackscrews.

(e) Remove the case.

(16) Remove the 9th stage compressor air seal.

(a) Install six .250−28 jackscrews in equally spaced threaded holes in the rear flange of the 8th stage case.

(b) Evenly tighten the jackscrews to loosen the 9th stage air seal.

(c) Remove the jackscrews.

(d) Remove the air seal.

Subtask 72−35−04−040−011:

(17) Remove the 8th stage compressor case assembly. See Figure 505 (Sheet 1) for the symmetric case configuration, or Figure 505 (Sheet 2) for the asymmetric case configuration.

(a) Remove the nuts or bolts, as applicable, and washers that attach the 8th stage case to the 8th stage air seal.

NOTE: You can use a flexible extension (such as a Snap−On GSYMU101) to remove the nuts.

(b) Put three PWA 105588 Jackscrew Pullers equally spaced at through hole positions in the front (lower) flange of the 8th stage case.

(c) Put the detail pin of the Puller in the through hole in the front (lower) flange of the 8th stage case, and the flat plate against the rear (upper) flange of the case.

(d) Use a standard wrench to turn the detail driver of the three Pullers approximately one turn each, one at a time, to remove the case from the air seal. If necessary, remove and reposition the three Pullers to another three equally spaced locations and repeat the above procedure to remove the case.

(e) Remove the Pullers.

(f) Remove the case.

Subtask 72−35−04−040−012:

(18) Remove the HPC front case segments from the PWA 105565 Support Fixture. See Figure 506.

R (a) Use the PWA 86536 Adapter and/or PWA 107300
R Adapters to remove the 22 nuts (506/1) and bolts (506/2) that attach the HPC front case set upper and lower segments.

(b) Remove the screw assemblies that attach the front (lower) flange of the HPC front case segments to the Fixture.

(c) Remove the 8th stage air seal from the upper flange of the HPC front case segments.

(d) Remove the upper and lower HPC front case segments from the Fixture.

(e) Remove the tape from the case halves.

(f) Remove any remaining tape adhesive. Use the SPOP 208 (Task 70−21−00−110−040) wipe method, Standard Practices Manual, PN 585005.

(19) If necessary, remove the locks and the 5th stage shroud set segments.

(20) If necessary for the asymmetric case configuration, remove the locks and the 6th and 7th stage shroud set segments.

Subtask 72−35−04−040−013:

(21) Remove all raised material from the front and rear edges of the 8th through 15th stage air seal rubstrips. Break edges 0.003 − 0.015 inch (0.08 − 0.38 mm).

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − DISASSEMBLY−01

(22) Use a vacuum to clean the detail air seal set parts.

(23) Clean the detail parts of the HPC outer air seal set (Stages 5 through 15). Refer to 72−35−00, Cleaning−01, PW4000 Series CIR, PN 51A357.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET - ASSEMBLY-01

Task 72-35-04-440-001:

1. Assemble The HPC Outer Air Seal Set, Stages 5 Through 15

A. Prerequisites

(1) See 72-35-00, Inspection/Check-04, CONFIG-2 (Task 72-35-00-990-010) or, CONFIG-4 (Task 72-35-00-990-011) as applicable for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Necessary

Standard Tools:

Optional, Wrench (Extended Socket) Part No. QCL 5/16-2D-3/16 Used With Optional Cleco Air Gun	Brimatco Corporation P.O. Box 88 1486 Highland Ave. Cheshire, CT 06410 USA
Optional Cleco Air Gun (Nutrunner) PN 44RNAL-2-H-3, or PN 44RNAL-2RA8 Or Equivalent	Local Distributor Or, Cooper Tools Sales and Service P.O. Box 1410 Lexington, SC 29071-1410 USA
Optional, Flexible Extension Part No. GSYMU101 Or Equivalent	Snap-On Technologies Inc. P.O. Box 1430 Kenosha, WI 53141-1430 USA

NOTE: The optional Brimatco wrench (extended socket) PN QCL 5/16-2D-3/16 can be use with the Cleco Air Gun to help install the flange nuts on the 8th through 14th stage compressor cases.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 86536	Adapter, Torque (HPC Front Case, Split Flange)
PWA 87485	Gage, Indicating (Concentricity Check)
PWA 88673	Sling
PWA 100221 "A"	Fixture, Machining
PWA 100379	Pin, Alignment (12th Stage Compressor Air Seal Installation)
PWA 102260	Adapter, Torque (9th Through 14th Stage Compressor Case Flange Nuts)
PWA 105504	Adapter, Lift (HPC Rear Case (Rear)
PWA 105506	Ring, Constraint (Concentricity Check)
PWA 105528	Spacer, Build (8th Stage Air Seal) (For The Symmetric Case C onfiguration)
PWA 105565	Fixture, Support
PWA 105609	Pin, Alignment (2 Necessary) (HPC Rear Case Installation)
PWA 105768	Spacer, Positioning (40 Necessary)

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−135	Tape, Reflective (PMC 4235)
P05−341	Tape, Plastic (Yellow) (PMC 4134)
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P05−448	Masking Tape (Heavy) (PMC 4170)

C. Procedure

NOTE: The HPC outer air seal set (Stages 5 through 15) (called seal set) consists of the HPC front case set, 5th through 7th stage HPC shroud sets, 8th through 15th stage HPC air seal assemblies, 8th through 14th stage compressor case assemblies, and the HPC rear case set. These parts will be assembled and the air seals machined as a set. The seal set detail parts are identified by the Letter M followed by the last five digits of the HPC rear case serial number.

Subtask 72−35−04−440−001:

(1) Put the HPC rear case on a bench.

(a) Attach a hoist to the lift hole in PWA 105504 Adapter. Use the hoist to lift the Adapter and put it over the rear flange of the HPC rear case. Align the boltholes in the Adapter with the boltholes in the case. Install the Adapter to the HPC rear case with eight detail screw assemblies and four nut plates.

NOTE: The Adapter has a scribed line on the OD of the Adapter. Align this line with the offset hole in the HPC rear case (rear flange).

(b) Use the hoist to put the HPC rear case on a bench, rear (smaller ID flange) end up. Remove the screw assemblies and nut plates that attach the Adapter to the case. Remove the adapter from the case.

(2) Mark the outer air seal set part number and the mating number on the HPC rear case. See Figure 1001 (Sheet 1).

(a) Locate the 2 inch by 2 inch (50.800 mm by 50.800 mm) marking area on the outside wall of the case.

(b) If it is not there, write "SET" followed by the part number of the HPC outer air seal set. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006). or manual vibration peening. See 70−11−00, Standard Practices Manual, PN 585005.

(c) The seal set mating number is the Letter M followed by the last five digits of the HPC rear case serial number. If it is not on the marking area, deep electrolytic etch or manual vibration peen the Letter M followed by the last five digits of the HPC rear case serial number.

NOTE: The seal set mating number will be marked on all details of the seal set.

(3) If necessary, remove the work bolts that attach the upper and lower halves of the HPC front case assembly. Attach a suitable sling to a hoist and the rear flange of the HPC front case segment. Put both halves of the HPC front case assembly on a workbench, with the larger diameter flange end down, and the outer diameter toward the assembler. Remove the sling and hoist.

(4) Check the front case set for the same compressor case set mating number on the "UPPER and "LOWER" case segments. See Figure 1002.

NOTE: All markings are located on the outer face of the vertical mating flange or, on the OD of the case above the larger OD bolt flange.

(5) If it is not there, mark the seal set mating number on the HPC front case upper and lower segments adjacent to the part numbers.

NOTE: The seal set mating number is "M" followed by the last five digits of the HPC rear case serial number.

(a) If necessary, mark the mating number adjacent to the part number. Use the deep electrolytic etch method by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. Marks must be 0.090 inch (2.286 mm) minimum in height.

(6) If it is not there, put marks on the 5th stage shroud set details (all six pieces) to show the seal set mating number as follows:

NOTE: All markings are located on the convex side of the liner segments. The seal set mating number is "M" followed by the last five digits of the HPC rear case serial number.

(a) If necessary, put a mark to show the seal set mating number adjacent to the segment mating letters. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. See 70−11−00, Standard Practices Manual, PN 585005.

(b) Marks must be 0.090 inch (2.286 mm) minimum in height.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01

(7) For the asymmetric case configuration, if they are not there, put marks on the 6th and 7th shroud set details (all 12 pieces) to show the seal set mating number as follows:

NOTE: All markings are located on the convex side of the liner segments. The seal set mating number is "M" followed by the last five digits of the HPC rear case serial number.

(a) If necessary, put a mark to show the seal set mating number adjacent to the segment mating letters. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. See 70−11−00, Standard Practices Manual, PN 585005.

(b) Marks must be 0.090 inch (2.286 mm) minimum in height.

(8) If it is not there, put a mark on each of the 8th through 15th stage compressor air seals to show the seal set mating number. See Figure 1003 (Sheet 1).

(a) If necessary, make a mark to show the seal set mating number. Put the mark on the rear side of the bolt flange between bolt holes adjacent to the prior part number mark.

NOTE: The HPC rear case mating number is "M" followed by the last five digits of the HPC rear case serial number.

(b) Use the deep electrolytic etch method by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. The marks must be 0.090 inch (2.286 mm) minimum in height. See 70−11−00, Standard Practices Manual, PN 585005.

(c) If you used the vibration peen method in the above step, you must remove any raised material.

(9) If it is not there, put a mark on each of the 8th through 14th stage compressor case assemblies to show the seal set mating number. See Figure 1003 (Sheet 1).

(a) If necessary, make a mark to show the seal set mating number. Put the mark on the rear side of the rear bolt hole flange, between bolt holes, in line with the prior part number mark.

NOTE: The HPC rear case mating number is "M" followed by the last five digits of the HPC rear case serial number.

NOTE: The rear flange of the case assemblies is the flange with dowel bolts.

(b) Use deep electrolytic etch method by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. The marks must be 0.090 inch (2.286 mm) minimum in height. See 70−11−00, Standard Practices Manual, PN 585005.

(10) If it is not there, put a mark on the HPC rear support to show the seal set mating number. See Figure 1003 (Sheet 1).

(a) Apply Masking Tape P05−448 to the radius surface of the HPC rear support to protect the aluminum coating.

(b) Put the mating number between boltholes adjacent to the part number. The mark must be 0.125 inch (3.175 mm) minimum from the edge of holes and the flange edge. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. Refer to 70−11−00, Standard Practices Manual, PN 585005.

NOTE: The HPC rear case mating number is "M" followed by the last five digits of the HPC rear case serial number.

(11) For the symmetric case configuration, if it is not there, put a mark on the HPC spacer set to show the seal set mating number. See Figure 1003 (Sheet 2).

(a) Put the mating number on the rear side (narrow mid flange) of the spacer set (both halves) between boltholes adjacent to the part number. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. The marks must be 0.090 inch (2.286 mm) minimum in height. Refer to 70−11−00, Standard Practices Manual, PN 585005.

NOTE: The HPC rear case mating number is "M" followed by the last five digits of the HPC rear case serial number.

(12) For the symmetric case configuration, if it is not there, put marks on the air seal support segment set to show the seal set mating number. See Figure 1003 (Sheet 3).

(a) Put the mating number on the OD of each of the support segments (four pieces) adjacent to the existing marks. The marks must be 0.090 inch (2.286 mm) minimum in height. Use deep electrolytic etch by SPOP 401 (Task 70−11−00−280−006) or manual vibration peening. Refer to 70−11−00, Standard Practices Manual, PN 585005.

NOTE: The HPC rear case mating number is "M" followed by the last five digits of the HPC rear case serial number.

Subtask 72−35−04−440−002:

(13) (For the symmetric and asymmetric case configurations) Install the 5th stage shroud set in the front case. See Figure 1004 (Sheet 1).

(a) Put the front case segments on a workbench, with the larger diameter bolt flange diameter down, and the inner diameter toward the assembler, with the upper segment on the assembler's right and the lower segment on the left.

NOTE: The segments are marked "UPPER" and "LOWER" on a pad on the outside of the case or on the edge of the split flange.

(b) Obtain the 5th stage shroud set. Make sure that all shroud segments have the same mating number and location letters are marked on the ends of the segments.

(c) Put the liner segments on the bench to form two semi−circles.

1 The semi−circle on the left (for the lower case) has segments with marks (from left to right) A−F, F−E, E−D.

2 The semi−circle on the right (for the upper case) has segments with marks (from left to right) D−C, C−B, B−A.

(d) Install the segments from the right semi−circle into the lower most slot in the ID of the case segment marked "UPPER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment with the notched end is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(e) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(f) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004 (Sheet 2).

(g) Install the segments from the left semi−circle into the lower most slot in the ID of the case segment marked "LOWER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(h) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(i) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004.

(j) Install a lock, longer, bent end down and conferred side toward the liner segment (with the lock ends pointing inward) to fit into the groove on the right side of the case segment and press to install the lock. The lock must be flush with the vertical flange of the case segment. Repeat this procedure to install the remaining lock in the upper case segment. If necessary, use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the locks in position.

(14) (For the asymmetric case configuration) Install the 6th stage shroud set in the front case. See Figure 1004 (Sheet 3).

(a) Put the front case segments on a workbench, with the larger diameter bolt flange diameter down, and the inner diameter toward the assembler, with the upper segment on the assembler's right and the lower segment on the left.

NOTE: The segments are marked "UPPER" and "LOWER" on a pad on the outside of the case or on the edge of the split flange.

(b) Obtain the 6th stage shroud set. Make sure that all shroud segments have the same mating number and location letters are marked on the ends of the segments.

(c) Put the liner segments on the bench to form two semi−circles.

1 The semi−circle on the left (for the lower case) has segments with marks (from left to right) A−F, F−E, E−D.

2 The semi−circle on the right (for the upper case) has segments with marks (from left to right) D−C, C−B, B−A.

(d) Install the segments from the right semi-circle into the lower most slot in the ID of the case segment marked "UPPER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment with the notched end is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(e) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(f) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004 (Sheet 2).

(g) Install the segments from the left semi-circle into the lower most slot in the ID of the case segment marked "LOWER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(h) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(i) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004 (Sheet 2).

(j) Install a lock, longer, bent end down and conferred side toward the liner segment (with the lock ends pointing inward) to fit into the groove on the right side of the case segment and press to install the lock. The lock must be flush with the vertical flange of the case segment. Repeat this procedure to install the remaining lock in the upper case segment. If necessary, use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the locks in position.

(15) (For the asymmetric case configuration) Install the 7th stage shroud set in the front case. See Figure 1004 (Sheet 4).

(a) Put the front case segments on a workbench, with the larger diameter bolt flange diameter down, and the inner diameter toward the assembler, with the upper segment on the assembler's right and the lower segment on the left.

NOTE: The segments are marked "UPPER" and "LOWER" on a pad on the outside of the case or on the edge of the split flange.

(b) Obtain the 7th stage shroud set. Make sure that all shroud segments have the same mating number and location letters are marked on the ends of the segments.

(c) Put the liner segments on the bench to form two semi−circles.

1 The semi−circle on the left (for the lower case) has segments with marks (from left to right) A−F, F−E, E−D.

2 The semi−circle on the right (for the upper case) has segments with marks (from left to right) D−C, C−B, B−A.

(d) Install the segments from the right semi−circle into the lower most slot in the ID of the case segment marked "UPPER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment with the notched end is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(e) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(f) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004 (Sheet 2).

(g) Install the segments from the left semi−circle into the lower most slot in the ID of the case segment marked "LOWER". Start with the liner segment with the notched end, and insert the liner segment into the lower most slot in the ID of the case until the liner segment is flush with the right vertical flange.

NOTE: The liner segments must be installed so that the mated ends are together (i.e. AA, BB, CC, etc.).

(h) Install the next liner segment so that the mating end will mate with the first liner segment. If necessary use a nylon drift to lightly tap on the end of the liner segment. Install the remaining liner segment.

(i) Make sure that the notched end of the liner segment at the right vertical flange is in the limit specified in Figure 1004 (Sheet 3).

(j) Install a lock, longer, bent end down and conferred side toward the liner segment (with the lock ends pointing inward) to fit into the groove on the right side of the case segment and press to install the lock. The lock must be flush with the vertical flange of the case segment. Repeat this procedure to install the remaining lock in the upper case segment. If necessary, use Beeswax P05−395 or Paraffin Wax Blend P05−396 to hold the locks in position.

CAUTION: THE FELTMETAL RUBSTRIPS MUST NOT BE EXPOSED TO ANY LUBRICANT PRIOR TO ENGINE INSTALLATION.

(16) (For the symmetric case configuration) install the 6th and 7th stage shroud set and the HPC spacer set to the HPC front case halves. See Figure 1005 (Sheet 1).

(a) Install the 6th and 7th stage shroud set (lower half) (1005/4) to the HPC front case (lower half) (1005/7), engaging the lip in shroud to groove in the HPC front case.

(b) Align the holes in the bolt flanges with the holes in the HPC front case and lower the spacer set (lower half) segment, wide mid−flange down, on the 6th and 7th stage shroud segment (1005/4).

(c) Apply Engine Oil P03−001 to ten bolts (1005/3).

(d) Install the ten lubricated bolts (1005/3) fingertight.

(e) Tighten and torque the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Repeat the above steps to install the 6th and 7th stage shroud (upper half) (1005/5) in the upper HPC front case half.

(g) Measure from the rear face of the front case rear flange to the upper face of the spacer at eight equally spaced locations. See Figure 1005 (Sheet 2).

(h) Record the average Dimension Y.

(17) Use Tape P05−135 to cover all variable vane trunnion holes on the ID surface of split case halves. Do not apply tape to any portion of the 5th through 7th stage liner segments or to the face and snap ID of the case at either end.

Subtask 72−35−04−440−003:

(18) Install the front case assembly on the PWA 105565 Support Fixture. See Figure 1006.

(a) Use a hoist to connect PWA 88673 Sling, with two PWA 76154 Adapters, to PWA 105565 Support Fixture. Use the hoist to put the Fixture, with the four support feet down, on a suitable build stand.

(b) Make sure that the locks are fully installed on the 5th stage shroud segments.

(c) Put the "UPPER" case segment over the support Fixture. Align the boltholes and lower the case onto the Fixture, with the split in the case at 90 and 270 degrees, and the top of the case at the top dead center 0 degree mark on the Fixture.

(d) Put the "LOWER" case segment over the support Fixture. Align the boltholes and lower the case onto the Fixture, with the split in the case at 90 and 270 degrees, and the bottom dead center of the case at the 180 degrees mark on the Fixture.

(e) Apply Engine Oil P03-001 to the 20 detail bolt assemblies of the PWA 105565 Support Fixture.

(f) Assemble the case segments to the Fixture with a minimum of three lubricated bolt assemblies (bolt heads up). Install the bolts in each half section (one at each end and one at the approximate center). Tighten the bolts fingertight.

(19) (Reference 1553) Assemble the two halves of the HPC front case set. See Figure 1006.

(a) Install 22 bolts (1006/2), bolt heads against the flange of the case marked "UPPER", and nuts (1006/1) to the vertical flanges of the case halves. Tighten the bolts fingertight.

NOTE: See Figure 1006 for the preferred bolt position. The bolts can be installed in a different direction to if necessary.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(b) Use PWA 86536 Adapter to torque the axial flange bolts (1006/2) to 565 - 595 lb-in. (63.836 - 67.226 N.m) in the following sequence.

(c) Start at Hole 1L and torque the bolts in the following sequence: 1L, 1R, 2L, 2R, 3L, 3R, 4L, 4R, 5L, 5R, 6L, 6R, 7L, 7R, 8L, 8R, 9L, 9R, 10L, 10R, 11L, 11R.

R NOTE: The flange bolt hole sequence starts at the middle as shown. The Letter L refers to the left axial flange. The Letter R refers to the right axial flange, aft, looking forward.

(d) Make sure that each axial flange is properly installed. A gap of 0.005 inch (0.127 mm) is permitted if the gap does not extend through the flange.

(e) Install the remaining Fixture detail bolts, threads lubricated with Engine Oil P03−001, through the case flange and into the Fixture. Assemble the nuts to install the case.

(f) Use an alternating pattern to tighten and torque the nuts that attach the case to the support to 250 − 270 lb−in. (28.246 − 30.506 N.m).

Subtask 72−35−04−440−004:

(20) For the symmetric case configuration, instal the air seal support segment set to the 8th stage compressor air seal. See Figure 1007 (Sheet 1).

(a) Obtain the 8th stage compressor (duct) air seal (1007/2) and the air seal support segment set (1007/5).

(b) Verify that the mating number on the parts is correct.

(c) Put the air seal (1007/2) on the work bench rear (longer flange end) up.

(d) Move in a clockwise direction and instal the support segment with the (−02) to the right of the timing mark on the air seal at the top (12 o'clock) position.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01

(e) Align the holes and attach the support segment with two machine screws (1007/2) at Location K. See Figure 1007 (Sheets 2 and 4).

(f) Repeat the above steps and install the remaining three segments (−03), (−04), and (−05).

(g) Use a 0.001 inch (0.025 mm) feeler stock to check for gaps at the interface between the air seal support segments (1007/5) and the air seal (1007/2). See Figure 1007 (Sheet 1).

(h) If gaps are found, install up to eight PWA 105528 Spacers with nuts (1007/1), lubricated with Engine Oil P03−001, onto the bolts at the affected support segment. Tighten the nuts to 150 lbf−in. (16.948 N.m) maximum to close the gap. See Figure 1007 (Sheet 1).

(i) Turn the air seal assembly to the rear end down position. See Figure 1007 (Sheet 3).

(j) Measure the Distance D, at eight equally spaced locations.

(k) Record the average as Dimension D.

(l) Obtain the previously recorded Dimension Y.

(m) Subtract the Dimension D from the Dimension Y and record the result as Dimension M.

(n) Select the spacer class AF from Table 1001.

Dimension M	Spacer AF Class
0.019 − 0.020 Inch (0.483 − 0.508 mm)	1
0.021 − 0.023 Inch (0.534 − 0.584 mm)	2
0.024 − 0.026 Inch (0.610 − 0.660 mm)	3
0.027 − 0.029 Inch (0.686 − 0.736 mm)	4

Determine Spacer Class
Table 1001

(CONTINUED)

Dimension M	Spacer AF Class
0.030 - 0.032 Inch (0.762 - 0.812 mm)	5
0.033 Inch (0.838 mm)	6

Determine Spacer Class
Table 1001 (Continued)

(o) Starting at the (-05) segment, disassemble each support segment and install the correct classified spacer (1007/3) (ovalized hole to the assemblers left) and reassemble with two machine screws (1007/2) in each segment. See Figure 1007 (Sheet 4).

(21) Install the 8th stage compressor air seal onto the HPC front case assembly. See Figure 1008 (Sheet 1 or 2) as applicable.

(a) Make sure that the air seal (1008/1) has the correct seal set mating number.

(b) Locate the reference line on the OD of the air seal flange.

NOTE: The 8th stage air seal Flange OD has a reference line at the approximate 12 o'clock position.

(c) Put the air seal (shorter leg of rubstrip down) on the rear flange of the HPC front case.

(d) Align the offset hole in the air seal inner bolt hole pattern with the offset hole in the HPC front case rear flange. This is at approximately the 12 o'clock (0 degree) position.

(e) Install a minimum of 40 PWA 105768 Spacers, equally spaced, between the 8th stage air seal (1008/1) and the rear flange of the HPC front case.

(22) Install the 8th stage compressor case. See Figure 1009 (Sheet 1 or 2) as applicable.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01

(a) Make sure that the case (1009/1) has the correct seal set mating number.

(b) Install the case (1009/1), rear flange with bolts up, on the 8th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 8th stage air seal.

NOTE: The 8th stage case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the offset hole in the front flange of the case with the offset hole in the 8th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) For the symmetric case configuration, apply Engine Oil P03−001 to the 32 nuts (1009/2). See Figure 1009 (Sheet 1).

(e) For the symmetric case configuration, install 16 lubricated nuts (1009/2) and washers (1009/3), eight pairs equally spaced, to the bolts through the front flange of the 8th stage case (1009/1).

NOTE: If necessary you can use a Snap−On Extended Socket PN GSYMU101 to install the nuts.

(f) For the asymmetric case configuration, apply Engine Oil P03−001 to the 32 bolts (1009/2). See Figure 1009 (Sheet 1).

(g) For the asymmetric case configuration, install 16 lubricated bolts (1009/2) and washers (1009/3), eight pairs equally spaced, to the through the boltsholes in the front flange of the 8th stage case (1009/1).

(h) Tighten and torque 16 nuts (1009/2) or bolts (1009/2) total as applicable, eight pairs at Location R, in the special sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m).

(i) Install the remaining 16 lubricated nuts (1009/2), and washers (1009/3), equally spaced, to the bolts through the front flange of the 8th stage case (1009/1).

(j) Use an alternating pattern (180 degrees apart) to tighten and torque the remaining nuts (1009/2) to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(k) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−005:

(23) Install the 9th stage compressor air seal assembly. See Figure 1011.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 9th stage air seal (1011/1), longer leg of air seal down, onto the 8th stage compressor case. Align the offset hole of the air seal with the offset hole in the rear flange of the 8th stage case at approximately the 12 o'clock position.

NOTE: The 9th stage air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the air seal reference line with the reference line on the OD of the 8th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 lubricated work bolts (boltheads down), washers (1011/3), and work nuts (1011/2) equally spaced into the 9th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in.

(15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

NOTE: You can use the PWA 102260 Adapter to torque the case flange nuts for all stages.

(f) Remove the work bolts, washers, and nuts.

(24) Install the 9th stage compressor case assembly. See Figure 1012.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case (1012/1), rear flange with bolts up, on the 9th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 9th stage air seal.

NOTE: The 9th stage case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 9th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 32 bolts.

(e) Install 32 lubricated bolts (boltheads down), washers (1012/3), and nuts (1012/2), 16 pairs equally spaced through the boltholes in the front flange of the 9th stage case.

(f) Tighten and torque 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten nuts until no loss of torque occurs.

NOTE: You can use the PWA 102260 Adapter to torque the flange nuts for all stages.

(g) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(h) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−006:

(25) Install Install the 10th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 10th stage air seal, longer leg of the air seal down, on the 9th stage case. Align the offset hole in the air seal, at the approximate 12 o'clock position, with the offset hole in the rear flange of the 9th stage case.

NOTE: The 10th stage air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the air seal reference line with the reference line on the OD of the 9th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 lubricated work bolts (boltheads down), washers, and nuts equally spaced into the 10th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(f) Remove the work bolts, washers, and nuts.

(26) Install the 10th stage compressor case assembly.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case, rear flange with bolts up, on the 10th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 10th stage air seal.

NOTE: The 10th stage case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 10th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 32 bolts you will use to install the 10th stage case.

(e) Install 32 lubricated bolts (boltheads down), washers (two under each nut), and nuts, 16 pairs equally spaced through the boltholes in the front flange of the 10th stage case.

NOTE: Do not install a bolt in the bolthole just to the left of the borescope boss and the bolthole just to the right clockwise of the 6th stage anti−rotation lug at this time.

(f) Tighten and torque 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten nuts until no loss of torque occurs.

(g) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(h) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−007:

(27) Install the 11th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 11th stage air seal, larger OD and shorter leg of the air seal down, on the 10th stage case. Align the offset hole in the 11th stage air seal with the offset hole in the rear flange of the 10th stage case.

NOTE: The 11th stage air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the air seal with the reference line on the rear Flange OD of the 10th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 work bolts (boltheads down), washers, and nuts equally spaced into the 11th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(f) Remove the work bolts, nuts and washers.

(28) Install the 11th stage compressor case assembly.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case, rear (larger OD) flange up, on the 11th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 11th stage air seal.

NOTE: The 11th stage case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 11th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 32 bolts you will use to install the 11th stage case.

(e) Install 32 lubricated bolts (boltheads down), washers, and nuts, 16 pairs equally spaced through the boltholes in the front flange of the 11th stage case.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(f) Use a PWA 102260 Torque Adapter with a 3/8 inch drive to tighten and torque 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten nuts until no loss of torque occurs.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(g) With the Torque Adapter, use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(h) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−008:

(29) Install the 12th stage compressor air seal assembly. See Figure 1013.

(a) Install three PWA 100379 Alignment Pins equally spaced in the larger, 0.300 inch (7.620 mm), boltholes in the rear flange of the 11th stage case.

(b) Make sure that the air seal has the correct seal set mating number.

(c) Install the 12th stage air seal (1013/1) (larger OD of the air seal down) on the 11th stage compressor case. Align the offset hole in the air seal with the offset hole in the rear flange of the 11th stage case.

NOTE: The 12th stage compressor air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the air seal with the reference line on the rear Flange OD of the 11th stage case.

(d) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(e) Install a minimum of 30 work bolts (boltheads up), washers, and nuts equally spaced into boltholes in the 12th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(f) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(g) Remove the Alignment Pins, work bolts, washers, and nuts.

(30) Install the 12th stage compressor case assembly.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case, larger OD flange down, on the 12th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the air seal.

NOTE: The 12th stage compressor rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 12th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 32 bolts you will use to install the 12th stage case.

(e) Install the 32 lubricated bolts (boltheads up), washers, and nuts, 16 pairs equally spaced through the boltholes in the front flange of the 12th stage case.

(f) Tighten and torque 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten nuts until no loss of torque occurs.

(g) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(h) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−009:

(31) Install the 13th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Place the 13th stage compressor air seal (larger ID and longer leg of the rubstrip down) on the 12th stage compressor case. Align the offset hole of the 13th stage air seal with the offset hole in the rear flange of the 12th stage case.

NOTE: The 13th stage compressor air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the air seal with the reference line on the rear Flange OD of the 12th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 work bolts (boltheads down), washers, and nuts equally spaced into boltholes in the 13th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(f) Remove the work bolts, nuts, and washers.

(32) Install the 13th stage compressor case assembly.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case, rear flange with bolts up, on the 13th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the air seal.

NOTE: The 13th stage compressor case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 13th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 24 bolts you will use to install the 13th stage case.

(e) Install 24 lubricated bolts (boltheads down), washers, and nuts, 16 pairs equally spaced through the boltholes in the front flange of the 13th stage case.

(f) Apply Engine Oil P03−001 to the 12 nuts you will use to install the 13th stage case.

(g) Install 12 washers and lubricated nuts to the dowel bolts in the front flange of the 13th stage case fingertight.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(h) Tighten and torque the 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(i) Use an alternating pattern 180 degrees apart to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(j) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−010:

(33) Install the 14th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Place the 14th stage compressor air seal (larger ID rubstrip down) on the 13th stage compressor case. Align the offset hole of the 14th stage air seal with the offset hole in the rear flange of the 13th stage case.

NOTE: The 14th stage air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the air seal with the reference line on the rear Flange OD of the 13th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 work bolts (boltheads down), washers and nuts equally spaced into boltholes in the 14th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(f) Remove the work bolts, washers, and nuts.

(34) Install the 14th stage compressor case assembly.

(a) Make sure that the case has the correct seal set mating number.

(b) Install the case, rear flange with bolts up, on the 14th stage air seal. Align the offset hole in the front flange of the case with the offset hole in the 14th stage air seal.

NOTE: The 14th stage case rear Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the case with the reference line on the OD of the 14th stage air seal.

(c) Make sure that the mating surfaces are clean. If necessary, use shop air to remove unwanted material.

(d) Apply Engine Oil P03−001 to the 32 bolts you will use to install the 14th stage case.

(e) Install 32 lubricated bolts (boltheads down), washers (above the flange) and nuts, 16 pairs equally spaced, to the boltholes in the front flange of the 14th stage case.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(f) Tighten and torque the 16 nuts, eight pairs at Location R, in the sequence shown in Figure 1010 to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until no loss of torque occurs.

(g) Use an alternating pattern (180 degrees apart), to tighten and torque the remaining nuts to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the nuts until there is no loss of torque.

(h) Apply Tape P05−341 to the OD of the case to cover all through holes.

Subtask 72−35−04−440−011:

(35) Install the 15th stage compressor air seal assembly.

(a) Make sure that the air seal has the correct seal set mating number.

(b) Install the 15th stage air seal, heat shield retaining leg down, onto the 14th stage case. Align the offset hole in the air seal with the offset hole in the rear flange of the 14th stage case, at the approximate 12 o'clock position.

NOTE: The 15th stage air seal Flange OD has a reference line at the approximate 12 o'clock position. Align the reference line on the air seal with the reference line on the rear Flange OD of the 14th stage case.

(c) Apply Engine Oil P03−001 to a minimum of 30 work bolts.

(d) Install a minimum of 30 equally spaced lubricated work bolts, washers, under boltheads, into the 15th stage air seal flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(e) Use an alternating pattern (180 degrees apart) to tighten and torque the bolts to 140 − 150 lb−in. (15.818 − 16.948 N.m) to seat the air seal. Continue to tighten the nuts until no loss of torque occurs.

(f) Remove the work bolts and washers.

(g) At the 15th stage air seal Flange OD reference line location, make a temporary mark on the inner flange face of the air seal. Refer to 70−11−00, Standard Practices Manual, PN 585005.

NOTE: The 15th stage air seal Flange OD has a reference line at the approximate 12 o'clock position.

Subtask 72−35−04−440−012:

(36) Temporarily assemble the HPC rear support to the HPC rear case. See Figure 1014 (Sheet 1).

(a) Attach a hoist to the lift hole in the PWA 105504 Adapter.

(b) Use the hoist to lift the Adapter and put it over the rear flange of HPC rear case (1014/3) (smaller ID flange with nut plates).

(c) Align the boltholes in the Adapter with the boltholes in the HPC rear case (1014/3).

NOTE: The Adapter has a scribed line on the OD of the outer ring. Align this line with the offset hole in the rear flange of the HPC rear case.

(d) Install the Adapter to the HPC rear case (1014/3) with eight detail screw assemblies and four nut plates.

(e) Use the hoist to put the HPC rear case (1014/3) on a bench, with the case rear flange (smaller ID flange with nut plates) end up.

(f) Remove the screw assemblies and nut plates that attach the Adapter to the HPC rear case (1014/3), and remove the Adapter from the case.

(g) Make sure that the HPC rear support (1014/1) has the correct seal set mating number.

CAUTION: YOU CAN MIS−ASSEMBLE THE REAR SUPPORT ON THE HPC REAR CASE AND DAMAGE TO THE CASE AND/OR SUPPORT CAN OCCUR.

(h) Find the "X" mark on the rear inner flange of the HPC rear case (1014/3). This is at approximately the 12 o'clock position.

(i) Make a temporary mark on the outer flange of the case at the "X" location. Refer to 70−11−00, Standard Practices Manual, PN 585005.

(j) Find the reference 0.125 inch (3.175 mm) diameter non−through hole in the outer flange, rear face, of the HPC rear support (1014/1). This reference diameter is approximately at the 12 o'clock position.

(k) Use the reference diameter on the HPC rear support and the reference mark on the HPC rear case flange to align the boltholes in the HPC rear case rear flange and lower the rear support (1014/1) onto the HPC rear case (1014/3). See Figure 1014 (Sheet 1).

(l) Apply Engine Oil P03−001 to eight work bolts (.250−28), approximately 1 inch (25.400 mm) long, you will use to temporarily install in the HPC rear support (1014/1) to the HPC rear case (1014/3).

CAUTION: DO NOT USE AIR TOOLS TO TIGHTEN BOLTS INTO NUT PLATES OR DAMAGE TO THE MATING PARTS CAN OCCUR.

(m) Install the eight lubricated work bolts (1014/2) and washers equally spaced at Positions BD in the HPC rear support outer flange. Run down the bolts to just touch the flange face of the HPC rear support (1014/1). See Figure 1014 (Sheet 1) and Figure 1014 (Sheet 2).

NOTE: Based on operators experience, additional bolts and washers can be used to install the HPC rear support outer flange to the HPC rear case.

(37) Install two PWA 105609 Alignment Pins to the front flange of the HPC rear case. See Figure 1014 (Sheet 3).

  (a) Install one pin at the jackscrew hole at the 4 o'clock position, and the second pin at the 7 o'clock position.

  (b) To install the pin, remove the detail pin from the detail plate.

  (c) Position the screw and plate into the jackscrew hole at the front (lower) side of the rear flange of the HPC front case rear flange.

  (d) Align the threaded hole with the bolthole next to the jackscrew hole, and install the detail pin through the bolthole and thread it into the threaded hole in the detail plate.

  (e) Tighten the knurled screw to attach the pin to the case.

(38) Install the HPC rear case to the 8th stage compressor.

  (a) Install the PWA 105504 Adapter to the HPC rear case. See Figure 1014 (Sheet 4).

    1 Attach a hoist to the lift hole in the PWA 105504 Adapter.

    2 Use the hoist to lift and put the Adapter over the HPC rear case.

    NOTE: The Adapter has a scribed line on the OD of the outer ring. Align this line with the offset hole in the rear flange of the HPC rear case.

    3 Align the boltholes in the Adapter with the boltholes in the case.

    4 Install the Adapter to the HPC rear case with eight detail screw assemblies and four nut plates.

CAUTION: YOU CAN MIS−ASSEMBLE THE HPC REAR SUPPORT ON THE 15TH STAGE OUTER AIR SEAL IF YOU DO NOT PROPERLY ALIGN THE 12 O'CLOCK MARKS.

(b) Use the hoist to carefully lower the HPC rear case and rear support assembly over the 8th through 15th stage case assembly.

(c) Use the rear support as a guide to align the 12 o'clock position on the HPC rear case with the top dead center (TDC) on the 15th stage compressor air seal.

(d) Align the hole next to the reference hole in the OD flange of the rear support with the line on the 15th stage air seal OD, and lower the HPC rear case front flange onto the 8th stage air seal.

(e) Remove the screw assemblies and nut plates that attach the Adapter to the HPC rear case.

(f) Remove the Adapter from the case.

CAUTION: YOU CAN DAMAGE THE HPC REAR SUPPORT IF YOU DO NOT REMOVE BOLTS THAT ATTACH THE HPC REAR SUPPORT TO THE HPC REAR CASE.

(g) Remove all bolts that were used to attach the HPC rear support to the HPC rear case.

(h) Apply Engine Oil P03−001 to 89 work bolts (5/16−18 X 1 1/2 L) you will install in the boltholes in Flange H.

(i) Install a minimum of 40 equally spaced lubricated work bolts (bolt heads up), with washers, into the boltholes in Flange H. Install washers and nuts to the work bolts. See Figure 1014 (Sheet 5).

(j) Make sure that there is a minimum of one PWA 105768 Spacer next to each work bolt before you install the HPC rear case front flange to the 8th stage compressor air seal.

CAUTION: YOU CAN DAMAGE THE HPC REAR SUPPORT IF YOU DO NOT TIGHTEN THE WORK BOLTS EVENLY.

(k) You must monitor the HPC rear support while you tighten the bolts to make sure you install the HPC rear case evenly.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TOO MUCH TORQUE CAN DAMAGE THE PARTS.

(l) Use an alternating pattern (180 degrees apart) to tighten and torque the work bolts to 190 − 210 lb−in. (21.467 − 23.727 N.m). Continue to tighten the bolts until no loss of torque occurs.

(m) Loosen all of the work bolts used to install the HPC rear case front flange to the 8th stage air seal.

NOTE: Do not remove the bolts, washers, and nuts from Flange H.

(n) Remove all of the PWA 105768 Spacers located between the HPC front (split) case and the 8th stage air seal.

NOTE: You can use jackscrews in the HPC front (split) case to lift the seal set assembly weight off of the assembly Spacers. This can help you remove the assembly Spacers. Remove the jackscrews.

(39) Install the 8th stage air seal and HPC rear case to the HPC front case.

(a) Remove the two Alignment Pins from Flange H.

(b) Install the 49 remaining lubricated work bolts (bolt heads up), with washers, into the remaining boltholes in Flange H. Install washers and nuts to the work bolts.

(c) Use an alternating pattern (180 degrees apart) to tighten and torque all of the bolts in Flange H to 190 − 210 lb−in. (21.467 − 23.727 N.m). Continue to tighten the bolts until no loss of torque occurs.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−01

Subtask 72−35−04−440−013:

(40) Remove the HPC rear support from the HPC rear case assembly. If necessary, you can use jackscrews to remove the rear support from the HPC rear case.

(41) Inspect the air seal set for concentricity. See Figure 1015 (Sheet 1).

(a) Use a suitable sling to put the PWA 105506 Constraint Ring (step side down) over the rear flange of the HPC rear case.

(b) Align the dowel pin in the ring with the offset (dowel pin) hole in the HPC rear case rear flange at the 180 degree position of the HPC rear case, and lower the ring onto the case.

NOTE: The dowel pin in the Constraint Ring is at the 180 degree position.

(c) Use 12 cap screws (boltheads up), washers (under nuts), and nuts to install the Ring to the case.

(d) Use an alternating pattern (180 degrees apart) to tighten the bolts to install the Ring onto the case.

(e) Make sure that the Ring is against the rear flange of the HPC rear case.

(42) Put the PWA 87485 Gage on the rear of the Constraint Ring, with the two dowel pins on the bottom of the Gage against the outside diameter of the Constraint Ring. See Figure 1015 (Sheet 1).

(a) Adjust the detail indicator so it touches the OD snap diameter of the 15th stage air seal.

(b) Take measurements at 12 equally spaced locations on the OD of the 15th stage air seal.

(c) Make sure that the snap diameter of the 15th stage air seal is concentric to the HPC rear case within 0.020 inch (0.508 mm) at all 12 locations. See Figure 1015 (Sheet 2).

(d) Remove the Gage.

(43) Remove the Constraint Ring from the HPC rear case.

(a) Remove the cap screws, nuts, and washers that attach the Constraint Ring to the HPC rear case.

(b) Install jackscrews into six equally spaced threaded hole locations in the rear flange of the HPC rear case.

(c) Turn the jackscrews equally and evenly to loosen the Constraint Ring.

(d) Use a suitable sling and hoist to remove the Constraint Ring from the HPC rear case.

(e) Remove the jackscrews form the rear flange of the HPC rear case.

Subtask 72−35−04−440−014:

(44) Determine the rear support spacer thickness.

(a) Put a parallel bar across the rear face of the HPC rear case. See Figure 1016.

(b) Use a depth micrometer to measure the distance from the parallel bar to the rear face of the HPC rear case inner flange (inner bolt hole pattern) at eight equally spaced locations. Record the average of the eight distances as Dimension D.

(c) Use the same parallel bar to measure the distance from the parallel bar to the rear face of the 15th stage air seal bolt hole flange at eight equally spaced locations. Record the average of the eight readings as Dimension E.

(d) (Reference 1580) Subtract the Dimension D from Dimension E and record the result as Dimension M.

(e) Use Dimension M to determine the correct class of Spacer AB. Refer to Table 1002.

Dimension M	Spacer AB Class
0.236 − 0.241 inch (5.995 − 6.121 mm)	1
0.230 − 0.235 inch (5.842 − 5.969 mm)	2
0.224 − 0.229 inch (5.690 − 5.816 mm)	3
0.218 − 0.223 inch (5.538 − 5.664 mm)	4
0.212 − 0.217 inch (5.385 − 5.511 mm)	5
0.206 − 0.211 inch (5.233 − 5.359 mm)	6
0.200 − 0.205 inch (5.080 − 5.207 mm)	7
0.194 − 0.199 inch (4.928 − 5.054 mm)	8
0.188 − 0.193 inch (4.776 − 4.902 mm)	9

Determine Spacer Class
Table 1002

Subtask 72−35−04−440−015:

(45) Install the HPC rear support (1017/3). See Figure 1017 (Sheet 1).

(a) Install one of the correct spacer class Spacer AB (1017/4) with the ovalizied hole at the bottom (6 o'clock) position of the HPC rear case inner rear flange, then install the seven remaining spacers onto the flange.

(b) Make sure that the HPC rear support (1017/3) has the correct seal set mating number.

CAUTION: YOU CAN MIS−ASSEMBLE THE HPC REAR SUPPORT ON THE 15TH STAGE COMPRESSOR AIR SEAL IF THE HOLES WITH THE MARKINGS ARE NOT PROPERLY ALIGNED.

(c) Align the offset bolt hole in the HPC rear support (1017/3) with the bolt hole in the HPC rear case and 15th stage air seal.

NOTE: The HPC rear support has a reference spherical radius at the approximate 12 o'clock position.

(d) With the boltholes aligned, lower the HPC rear support (1017/3) onto the inner flange of the HPC rear case and the 15th stage air seal.

(e) Apply Engine Oil P03−001 to the 64 work bolts (1017/1).

CAUTION: DO NOT USE AIR TOOLS TO TIGHTEN NUTS ON DOWEL BOLTS OR BOLTS INTO NUT PLATES OR DAMAGE TO THE MATING PARTS CAN OCCUR.

(f) Install eight lubricated work bolts (1017/1) and washers (1017/2) equally spaced at Positions BD in the HPC rear support outer flange. Run down the bolts to just touch the flange face. See Figure 1017 (Sheets 1 and 2).

(g) Apply Engine Oil P03−001 to 18 bolts (1017/7).

(h) Install 18 lubricated work bolts (1017/7) and washers (1017/8) to the HPC rear support inner flange. Bolts are not necessary at Locations AU. See Figure 1017 (Sheets 1 and 3).

(i) Apply Engine Oil P03−001 to 24 work nuts (1017/5).

(j) Install 48 washers (1017/6) two on each dowel bolt, and work nuts (1017/5) to the 24 dowel bolts in the inner flange of the HPC rear support (1017/3). Tighten the nuts fingertight.

NOTE: You can use non−self locking work nuts to prevent over stressing the bill of material parts.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TOO MUCH TORQUE CAN DAMAGE THE PARTS.

(k) Use an alternating pattern 180 degrees apart to tighten and torque the inner flange work bolts (1017/7) to 140 − 150 lb−in. (15.818 − 16.948 N.m). Continue to tighten the bolts until no loss torque occurs.

(l) Install the remaining lubricated work bolts (1017/1) and washers (1017/2) to the HPC rear support outer flange.

CAUTION: WITH A TORQUE ADAPTER, ADJUST THE ACTUAL TORQUE WRENCH READING. TWO MUCH TORQUE CAN DAMAGE THE PARTS.

(m) Torque the 64 outer flange bolts (1017/1) to 105 − 115 lb−in. (11.863 − 12.993 N.m) using an alternating pattern 180 degrees apart. Continue to tighten the bolts until no loss torque occurs.

Subtask 72−35−04−440−016:

(46) Install PWA 100221 Machining Fixture. See Figure 1018.

(a) Make sure that the trunnion spools of the PWA 100221 Machining Fixture are in the INSTALL/REMOVE position.

(b) If necessary, remove the trunnion spool assembly and move them to the INSTALL/REMOVE position, torque the bolts.

(c) Use a hoist to attach the PWA 88673 Sling with two PWA 76154 Adapters to the Fixture.

(d) Use the hoist to put the Fixture (flat side up) over the case assembly.

CAUTION: USE CARE WHEN YOU INSTALL THIS FIXTURE TO PREVENT DAMAGE TO THE HPC REAR SUPPORT.

(e) Align the "TDC" mark on the Fixture with the 12 o'clock position of the case. Make sure that the dowel bolts in the 15th stage air seal are aligned with the mating holes in the Fixture. Align the boltholes and carefully lower the Fixture onto the case assembly.

(f) Install the 12 detail bolts (heads up) (1018/1) through the Fixture and into the HPC rear case. Install the detail spacers (1018/2) (under nuts) and nuts (1018/3).

(g) Use an alternating pattern (180 degrees apart) to tighten and torque the bolts to 160 - 175 lb-in. (18.078 - 19.772 N.m). Continue to tighten the bolts until no loss of torque occurs.

(h) Make sure that the Fixture is against the rear flange of the HPC rear case.

D. Postrequisites

(1) Machine the HPC Air Seal Set (Stages 5 Through 15). Refer to 72-35-04, Assembly-02 (Task 72-35-04-440-002).

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET - ASSEMBLY-02

Task 72-35-04-440-002:

1. Machine The Stages 5 Through 15 Outer Air Seal Set

   A. Prerequisites

      (1) Assemble the Stages 5 Through 15 Outer Air Seal Set (for outer air seal machine). Refer to 72-35-04, Assembly-01 (Task 72-35-04-440-001).

      (2) Obtain the blade tip gage point radii dimensions for the 5th through 15th stage rotors. Refer to 72-35-01, Assembly-03, CONFIG-2 (Task 72-35-01-440-026).

      NOTE: The blade tip gage point radii dimensions are necessary to determine if the blade tip radii were re-targeted for blade tip machining requirements. The seal set must be retargeted by the same amount as the rotor radii.

      NOTE: Dimension K in the following figures and tables is the allowable retargeting range at each corresponding stage. This is an allowable deviation from the nominal radius in order to target nominal tip clearances. It is not a manufacturing tolerance. For manufacturing tolerances, the profile tolerances as shown in the corresponding figures apply.

   B. Equipment And Materials Necessary

      Special Tools:
      PWA 76154 Adapter (4 Necessary)
      PWA 88673 Sling (2 Necessary)

   C. Procedure

      (1) Install the case assembly to the machine tool bed as follows.

         (a) Use a hoist to attach a PWA 88673 Sling with two PWA 76154 Adapters to the PWA 100221 Machining Fixture.

         (b) Use the hoist to lift the case assembly.

         (c) Use a second hoist to connect a PWA 88673 Sling with two PWA 76154 Adapters to the PWA 105565 Fixture.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−02

(d) Use both hoists to trunnion the case assembly to put the Machining Fixture end down.

(e) Remove the hoist, Sling, and Adapters from the lower Machining Fixture.

(f) Move the two Machining Fixture trunnion spools to the MACHINE/INSPECT position as follows.

  1 Remove the two bolts that attach the both trunnion spools.

  2 Turn the trunnion spools so that they are in the MACHINE/INSPECT position.

  3 Attach the trunnion spools with the Fixture bolts.

(g) Lower the assembly on the machine tool bed.

(h) Use the Machining Fixture base precision outside diameter or precision inside diameter and detail gage pads to align the Fixture to the VTL.

(i) Use the 12 outer holes of the of the Fixture base to attach the Fixture to the VTL.

(j) Remove the Adapters, Slings, and hoists.

NOTE: Do not remove the Fixture from the front (upper) end of the case assembly.

(2) For the 5th through 8th stage compressor air seals, the abradable rubstrip machining parameters are as follows.

R (a) For PWA 279−1, Tool specifications, speeds and
R feeds are as follows:

Tool: Single point Carboloy or Equivalent Carbide Tool

Radius 0.015 − 0.031 inch (0.38 − 0.79 mm)
Rake: 5° positive rake

Feed: 0.005 inch/revolution
(0.127 mm/revolution)

Speed: 450 feet surface feet/minute
(137.16 surface m/minute)

Depth of cut:
Rough Cut: 0.009 − 0.015 inch
(0.229 − 0.381 mm)
Finish Cut: 0.009 − 0.015 inch
(0.229 − 0.381 mm)

Lubricants: None Allowed

R (b) For PWA 24−1, Tool specifications, speeds and feeds are as follows:

R Tool: Single point Carboloy or Equivalent Carbide Tool
R Radius 0.015 − 0.031 inch (0.38 − 0.79 mm)
R Rake: 5° positive rake

R Feed: 0.006 − 0.008 inch/revolution
R (0.153 − 0.203 mm/revolution);
R the initial can be done at
R 0.003 inch/revolution (0.076 mm/revolution)
R Speed: 150 − 275 surface ft./minute
R (45.72 − 83.82 surface meters/minute)

R Depth of cut: 0.005 − 0.030 inch (0.13 − 0.76 mm)
R A 0.010 inch (0.254 mm) depth of
R cut is recommended

R Lubricants: None Allowed

(3) For the 9th through 15th stage compressor air seals, the abradable rubstrip machining parameters are as follows.

R (a) For PWA 284, Tool specifications, speeds and feeds are as follows:

Tool: Single point Carboloy or Equivalent Carbide Tool

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−02

Radius 0.031 inch (0.787 mm)
Rake: 5° positive side rake

Feed: 0.003 − 0.005 inch/revolution
(0.077 − 0.127 mm/revolution)

Speed: 300 surface feet/minute
(91.44 surface m/minute)

Depth of cut:
Rough Cut: 0.005 − 0.030 inch
(0.13 − 0.76 mm)
Finish Cut: 0.005 − 0.010 inch
(0.127 − 0.254 mm)

Lubricants: None Allowed

(4) Machine each air seal as shown in Figure 1001 (Sheets 1 through 6), and as follows.

NOTE: Tools dull at a higher rate than they do if solid material is machined. Dull tools produce a glazed surface which is unacceptable for an abradable seal. Attempts at high removal rates have tended to gouge the material and result in an unacceptable condition.

(a) For rough cuts, no more than six cuts for each insert.

(b) For semi−finish and finish cuts, a new cutting edge is required for each cut.

(c) Cutting should be as smooth, continuous, and uninterrupted as possible.

(d) Brush chips/dust away after each pass and prior to any measuring of the abradable rub strips by the machine probe or other measuring device. This will ensure correct inspection dimensions.

(e) If you cut the base material at either end of the abradable surface, the cuts should start in the middle of the abradable surface and machine towards the outside so that a metal burr will not be rolled into the abradable.

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−02

(5) Measure and record the air seal rubstrip diameters for each stage.

R NOTE: It is recommended that the air seal rubstrip profiles be measured on a separate Coordinate Measuring Machine (CMM) as required to make sure that the VTL is accurate.

NOTE: The rubstrip diameters will be used to calculate the blade tip clearances in 72−35−00, Inspection/Check−05, CONFIG−2 (Task 72−35−00−990−012).

(a) Take measurements in at least 18 equally spaced locations.

(b) Calculate and record the 5th through 15th stage average and local maximum and minimum radii for each stage from the measured data.

(6) If you retargeted the airseal from the nominal dimensions you must identify the HPC seal set and the HPC axial rotor as a matched set.

(7) Move the two Machining Fixture trunnion spools to the REMOVE/INSTALL position as follows.

(a) Remove the two bolts that attach the both trunnion spools.

(b) Turn the trunnion spools so that they are in the REMOVE/INSTALL position.

(c) Attach the trunnion spools with the Fixture bolts.

(8) Install the assembly to a suitable pallet (front end down) as follows.

(a) Use a hoist to attach the PWA 88673 Sling with two PWA 76154 Adapters to the Support Fixture.

(b) Lift the assembly from the tool bed.

(c) Use a second hoist to connect the PWA 88673 Sling with two PWA 76154 Adapters to the Machining Fixture.

(d) Use both hoists to trunnion the case assembly to front end down.

(e) Remove the hoist, Sling, and Adapters from the Support Fixture.

(f) Lower the case assembly onto a suitable pallet.

(g) Remove the Adapters, Slings, and hoists.

(9) Examine the assembly for foreign objects, damage, and correct assembly.

(10) Make sure that you install all the necessary protection covers.

D. Postrequisites

(1) Disassemble The Stages 5 Through 15 Outer Air Seal Set. Refer to 72−35−04, Disassembly−01 (Task 72−35−04−040−001).

Outer Air Seal Machining (Typical)
Figure 1001 (Sheet 1)
(Task 72−35−04−440−002)

STAGES 5 THROUGH 15 HPC OUTER AIR SEAL SET − ASSEMBLY−02

1. 34.568 − 34.572 Inch (878.028 − 878.128 mm) Diameter C, Reference.
2. Indicate To Within 0.004 Inch (0.102 mm) FIR. See The NOTE.
3. Indicate To Within 0.002 Inch (0.051 mm) FIR. This Can Be Up To 0.004 Inch (0.102 mm) FIR If Required To Balance The Seal Set On The Tool Bed To Obtain The Upper Runout Within 0.004 Inch (0.102 mm) FIR. See The NOTE.
4. 32.234 − 32.238 Inch (818.744 − 818.845 mm) Diameter B, Reference.
5. Maintain Clearance To This Dimension. Machining Of Surface P Is Permitted But May Not Be Required To Meet This Dimension.
6. 18.640 − 18.660 Inches (473.46 − 473.96 mm) From Datum A
7. 0.047 Inch (1.194 mm) Modified Radius Maximum

NOTE: These are recommended set−up requirements to make sure that the outer air seal machining dimensions meet the location tolerance requirements relative to the datums.

STAGE 5 HPC DISK AND BLADES ASSEMBLY - DISASSEMBLY-01

Task 72-35-37-040-001:

1. Disassemble Stage 5 HPC Disk And Blades Assembly

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 85162	Adapter, Lift And Trunnion
PWA 85163	Adapter, Lift And Trunnion
PWA 85165	Puller, Airseal
PWA 85328	Stand, Storage
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 102107	Pusher, Manual

B. Procedure

(1) Install PWA 85163 Adapter to blade tips. Attach PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters to the Adapter PWA 85163 and remove the disk and blade assembly from the storage stand. Place PWA 85328 Storage Stand on bench. Lower disk and blades to rest on storage stand, tierods down. Remove hoist, sling, and adapters. See Figure 501.

(2) Remove 40 nuts and bolts securing airseal to Stage 5 HPC disk and blades. Using PWA 85165 Airseal Puller, remove airseal from disk. See Figure 502.

(3) Reinstall Sling PWA 88643 or PWA 88673 with Adapters PWA 76154 and hoist to adapter on blade tips. Raise disk and blades and trunnion to tierod up. Lower disk and blades on stand. See Figure 503.

(4) Using PWA 102107 Pusher, remove tierods from disk flange. See Figure 504.

(5) Raise disk and blades from support and trunnion to flange side down on stand. Remove hoist, sling and adapters from adapter. Remove adapter from disk and blades assembly.

(6) Remove the 5th stage blades from the stage 5 HPC disk.

(a) Refer to Disassemble (Deblade) The Axial Compressor Rotor Assembly per 72-35-01, Disassembly-20 (Task 72-35-01-040-003).

(7) Install PWA 85162 Adapter to the hub. Use Sling PWA 88643 or PWA 88673 with Adapters PWA 76154 and put the disk onto the storage stand. Remove the hoist, sling and adapter. See Figure 505.

STAGE 5 HPC DISK AND BLADES ASSEMBLY - ASSEMBLY-01

Task 72-35-37-440-001:

1. Assemble Stage 5 HPC Disk And Blades Assembly

A. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 29754	Control
PWA 76154	Adapter (2 Necessary)
PWA 85129	Support
PWA 85162	Adapter, Lift And Trunnion
PWA 85335	Heater (Optional)
PWA 85426	Protector (Optional)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling

Consumable Materials:

Item No.	Designation
P03-001	Engine, Oil (PWA 521B)

B. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: TITANIUM HEATS UP MORE RAPIDLY THAN OTHER MATERIALS. TAKE EXTREME CARE WHEN HEATING TITANIUM PARTS. DO NOT EXCEED THE THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

STAGE 5 HPC DISK AND BLADES ASSEMBLY − ASSEMBLY−01

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

C. Procedure

(1) Install PWA 85162 Adapter to disk blade slots. Using hoist with PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters attached to adapter place disk on PWA 85129 Support, flange end down. Remove sling, hoist and adapter. See Figure 1001.

(2) For engines not incorporating integral inlet airseal and 5th stage disk (Pre SB PW4ENG 72−290), install inlet airseal.

(a) Install PWA 85335 Heater to rest on Stage 5 disk. Connect PWA 29754 Control and heat snap to temperature not to exceed 300°F (148.9°C). See Figure 1002.

(b) When temperature of disk flange is achieved shut off heater and remove from hub. Install airseal to disk flange aligning bolt holes. Allow area to cool to touch. See Figure 1003.

(c) Install 40 bolts, threads lubricated with Engine Oil P03−001, and nuts. Install bolts, heads up, and tighten and torque nuts to 32 − 36 lb−in. (3.616 − 4.067 N.m). Install PWA 85426 Protector on airseal.

(3) For engines incorporating integral inlet airseal and 5th stage disk (Post SB PW4ENG 72-290), install PWA 85426 Protector on airseal.

(4) Assemble the 5th stage blades in the disk.

  (a) Refer to Assemble The 5th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-31 (Task 72-35-01-440-019).

(5) Remove retaining ring from around disk.

(6) Temporarily add small strip of tape to each blade lock end to prevent lock from moving during balancing.

D. Postrequisites

(1) (Optional) Static Balance Disk And Blades Assembly. Refer to Assembly-02 (Task 72-35-37-440-002).

(2) Final Assemble The Stage 5 HPC Disk And Blades Assembly. Refer to 72-35-37, Assembly-03 (Task 72-35-37-440-003).

STAGE 5 HPC DISK AND BLADES ASSEMBLY - ASSEMBLY-02

Task 72-35-37-440-002:

1. Balance Stage 5 HPC Disk And Blades Assembly

NOTE: This procedure is optional. It is not necessary to balance Stage 5 HPC disk and blade assembly if you assemble an axial compressor rotor.

A. Prerequisites

(1) Assemble Stage 5 HPC disk and blades assembly per Assembly-01 Task 72-35-37-440-001.

B. Equipment And Materials Required

Special Tools:

PWA 25648	Hold-Down Screws (4 Necessary)
PWA 32492	Screw Set (2 Necessary)
PWA 76154	Adapter (2 Necessary)
PWA 80258	Locating Plugs (4 Necessary)
PWA 85163	Adapter, Lift And Trunnion
PWA 85190	Adapter
PWA 85191	Hold-Down Plugs (4 Necessary)
PWA 85192	Washers (4 Necessary)
PWA 85328	Stand, Storage
PWA 85460	Calibration Weight (Check Weight)
PWA 87213	Pin, Alignment (4 Necessary)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling

Consumable Materials:

Item No.	Designation
P04-005	Grease (Extreme Pressure) (PMC 9630)
P05-045	Marker (PMC 4092-1 or PMC 4092-2)
P05-323	Tape, Pressure Sensitive Sealing

C. Procedure

NOTE: Balance of Stage 5 HPC disk and blade assembly is only necessary if the fifth disk has been removed from the HPC drum rotor assembly, otherwise the Stage 5 blades are to be installed into the disk by means of the light to heavy procedure.

(1) Prepare the static balance locating adapter as follows: See Figure 1001.

STAGE 5 HPC DISK AND BLADES ASSEMBLY − ASSEMBLY−02

(a) Use a hoist and sling and attach the PWA 85190 Locating Adapter to the spindle of the balance machine with the four detail bolts.

1 Use an opposite bolt pattern and tighten the four bolts equally. Torque the bolts to 50 lb−in. (5.649 N.m) maximum.

CAUTION: SCREWS ARE IN SETS IN RELATION TO MASS WEIGHT. YOU MUST PUT SCREWS OF ONE SET DIAMETRICALLY OPPOSITE EACH OTHER. SCREWS OF ONE SET SHOULD NOT BE INTERCHANGED WITH SCREWS OF ANOTHER SET.

(b) Install the PWA 80258 Locating Plugs in the four locations on the adapter marked 5HPC. Attach the plug set to the balance adapter with the two PWA 32492 Screw Sets.

(c) Insert four PWA 85191 Hold−Down Plugs in the four threaded holes on the balance adapter marked 5HPC. Tighten the holding plugs hand tight.

(d) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(2) Adjustment of static balance adapter with hub snap diameter known (preferred method).

(a) Loosen each of four locating plugs and turn adjusting collars to "O" on scribed radial lines passing through center of adapter. Set "O" away from snap diameter to be engaged by locating plug button. Retighten locating plugs at this setting.

NOTE: Set "O" toward OD of adapter.

(b) Using dial indicator gage or micrometer caliper, measure snap contact diameter across diametrically opposite locating plug buttons. Record this dimension for reference.

(c) Subtract diameter of snap (as measured at inspection) from reference diameter in step above.

(d) Add pinch fit desired between locating plug buttons and hub to difference in diameters obtained in step above. This pinch fit may be from 0.0005T − 0.0040T inch (0.013T − 0.102T mm). A fit of 0.0020T inch (0.051T mm) will usually be satisfactory. Divide this sum by two.

(e) Loosen each of four locating plugs, set adjusting collars to result obtained in step above, and retighten four locating plugs.

NOTE: All four plugs should be set to same numerical marking.

(3) Adjustment of static balance adapter with hub snap diameter unknown (optional method).

(a) Loosen each of four locating plugs and turn adjusting collars to "O" on the scribed radial lines passing through center of adapter. Set "O" away from snap diameter to be engaged by locating plug button. Retighten locating plugs at this setting.

NOTE: Set "O" toward OD of adapter.

(b) Put the PWA 85163 Lift And Turn Adapter around the OD of the rotor assembly. Move the swivel bolt in the adapter slot and tighten the hand knob.

(c) Attach a hoist to the lift eye of the PWA 88643 Sling or PWA 88673 Sling. Attach the eyes of the sling to the lift arms of the adapter.

(d) Lift the assembly and put the assembly on the adapter. Align the tierod holes with the alignment pins on the holding plugs.

(e) Install center post and clamp dial indicator in position to measure radial movement of disk against locating plug buttons.

(f) Add pinch fit desired between locating plug buttons and disk to radial clearance obtained in step above. This pinch fit may be from 0.0005T − 0.0040T inch (0.013T − 0.102T mm). A fit of 0.0020 inch (0.051 mm) will usually be satisfactory. Divide this sum by two.

(g) Remove disk and blades assembly from adapter.

(h) Loosen four locating plugs, set adjusting collars to result obtained in step above, and retighten four locating plugs.

NOTE: All four plugs should be set to same numerical marking.

(4) Installation of disk and blades assembly in adapter. See Figure 1002.

(a) Apply small amount of Grease P04−005 to locating plug button, if desired.

(b) Turn adapter so that one of hold−down plugs is directly in front of operator. Mark hold−down plug nearest operator for reference with a Marker P05−045.

(c) Install hub and blades assembly on adapter using PWA 85163 Adapter, rear face toward adapter, by first letting it rest on locating plugs with snap diameter of disk engaging locating plug buttons on side away from operator.

(d) Turn disk on adapter until one of tierod holes is centered directly over hold−down plug button.

(e) With far side of disk snap diameter engaging locating plug buttons, press near side of disk down so that it snaps into a light pinch fit of locating plugs.

(f) To ensure locating plug buttons have firmly seated against snap diameter of disk, carefully lift disk on operators side until it breaks free. Again press down into light press fit.

(g) Mark the disk in line with referenced mark on hold down plug with a Marker P05−045.

(h) Insert four PWA 25648 Hold−Down Screws with PWA 85192 Washers through tierod holes of disk into hold−down plugs and secure disk.

NOTE: Tierod holes must be centered over hold−down plugs so that hold−down screws can be installed fingertight without interference before being torqued to nominal value. Torque each screw to same value.

(5) Operate the balance machine.

(a) Find the static unbalance of the rotor assembly while it turns at 900 rpm minimum.

(b) Get three unbalance readings. For balance machines that do not have an automatic recording feature, record the average angle and the average amount of unbalance.

(6) Turn the rotor assembly on the balance adapter 180 degrees from the original balance location as follows:

(a) Remove the screw sets and the washer set that attaches the rotor assembly to the adapter.

(b) Put the four PWA 87213 Alignment Pins in the threaded holes of the four holding plugs.

(c) Put the PWA 85163 Lift And Turn Adapter around the OD of the rotor assembly. Move the swivel bolt in the adapter slot and tighten the hand knob.

(d) Attach a hoist to the lift eye of the PWA 88643 Sling or PWA 88673 Sling. Attach the eyes of the sling to the lift arms of the adapter.

(e) Carefully lift the rotor off the adapter, turn it 180 degrees. Put the assembly on the balance adapter. Align the tierod holes with the alignment pins on the holding plugs.

(f) Make sure that the rotor assembly is tightly engaged against the four locating plugs. Remove the alignment pins.

(g) Attach the rotor assembly with a PWA 85192 Washer Set and two PWA 25648 Screw Sets.

1 Matching screws must be used at diametrically opposite positions.

2 Tierod holes must be centered over hold down plugs to prevent interference with screw installation.

(7) Operate the balance machine.

(a) Static balance the rotor assembly while it turns at 900 rpm minimum. The residual unbalance must not be more than 0.25 oz-in. (180.0 g.mm).

(b) For balance machines that have an automatic recording feature, get three unbalance readings. Average the readings. Use the machine to determine the unbalance amount and angle of the assembly.

(c) For balance machines that do not have an automatic recording feature, get three unbalance readings. Average and record the three unbalance readings. Use the average readings from the first and second balance runs to do a polar plot to get the assembly unbalance angle and amount.

(8) If the static unbalance is equal to 0.25 oz-in. (180.0 g.mm) or less continue as follows:

(a) Record the angle and the amount of unbalance.

(b) If necessary, remove all ink markings of unbalance symbols (triangle) that were done before.

(9) If the static unbalance is more than 0.25 oz-in. (180.0 g.mm), continue as follows:

NOTE: It is desirable to reduce residual unbalance to lowest value possible in practical amount of time.

(a) Use the PWA 85163 Lift And Turn Adapter to remove the rotor assembly from the balance adapter.

(b) Move the blades selected to correct the unbalance condition.

(c) Put the assembly on the balance adapter.

STAGE 5 HPC DISK AND BLADES ASSEMBLY - ASSEMBLY-02

(d) Static balance the rotor assembly as described above until the residual unbalance is not more than 0.25 oz-in. (180.0 g.mm).

(e) Record the heavy angle and the amount of assembly unbalance.

(f) Make a record of the last blade positions.

(10) Optional process based on the experience of the operator, do a check of the balance machine by Figure 1002 as follows:

(a) Install the PWA 85460 Calibration Weight (Check Weight) in one of the bolt holes on the disk as close as possible to the angle of residual unbalance.

(b) Attach the check weight to the disk with Pressure Sensitive Sealing Tape P05-323.

(c) The check weight pulls 3.0 oz-in. (2160.0 g.mm).

(d) Do a check of the balance machine at 900 rpm minimum.

(e) The amount of unbalance should pull 3.0 oz-in. (2160.0 g.mm) plus the remaining residual unbalance +/- 0.1 oz-in. (72.0 g.mm).

(f) Remove the check weight.

(11) Remove the disk and blade assembly from the adapters. Use PWA 85163 Adapter, hoist, PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapter.

(12) Place disk and blades assembly on PWA 85328 Storage Stand. Remove hoist, sling, and adapters.

D. Postrequisites

(1) Final assemble Stage 5 HPC disk and blades assembly by Assembly-03 Task 72-35-37-440-003.

STAGE 5 HPC DISK AND BLADES ASSEMBLY - ASSEMBLY-03

Task 72-35-37-440-003:

1. Final Assemble Stage 5 HPC Disk And Blades Assembly

A. Prerequisites

(1) (Optional) balance Stage 5 HPC disk and blades assembly. Refer to Assembly-02 (Task 72-35-37-440-002).

B. Equipment And Materials Necessary

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 78012	Bender, Pneumatic (Optional to PWA 100012 Change Letter A and PWA 102146)
PWA 80763	Inserter, Tierod
PWA 85196	Ring, Retaining
PWA 85328	Stand, Storage
PWA 86518	Bender, Mechanical (Optional to PWA 78012)
PWA 87128	Bender, Mechanical (Optional to PWA 86518)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 100012	Change Letter A Bender, Pneumatic (Prebend) (With PWA 102146, Optional to PWA 78012)
PWA 102146	Bender, Pneumatic (Final Bend) (With PWA 100012 Change Letter A, Optional to PWA 78012)

Consumable Materials:

Item No.	Designation
P09-014	Sealant, Silicone Rubber (PWA 36003)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Lock (Post SB PW4ENG 72-373)	40	72-35-00/2/10

C. Procedure

(1) Install hoist with PWA 88643 or PWA 88673 Sling and PWA 76154 Adapters on adapter (installed around blade tips). Raise and trunnion disk and blades so tiebolt flange faces up and lower onto PWA 85328 Storage Stand.

STAGE 5 HPC DISK AND BLADES ASSEMBLY - ASSEMBLY-03

(2) Install 42 tiebolts to flange using PWA 80763 Inserter. See Figure 1001.

(3) Raise disk and blades assembly and trunnion so tierods face down onto Support (PWA 85328). Remove hoist, sling, adapters and adapter from disk and blades. See Figure 1002.

(4) Install PWA 85196 Retaining Ring around HPC disk just below blade slots.

CAUTION: CARE SHOULD BE TAKEN TO ENSURE THAT ANY PRESSURE OR FORCE REQUIRED TO REMOVE OR INSTALL BLADE IN DISK, BE APPLIED TO ROOT PLATFORM AREA OF BLADE AND NOT TO LEADING OR TRAILING EDGE OF AIRFOIL. AIRFOIL SECTION OF BLADES ARE EASILY DAMAGED BY ANY KIND OF FORCE.

(5) Remove tape from ends of blade locks. Move blade lock to align cut-outs in lock with blade slots. Remove one blade from disk at a time. This will ensure that balance will not be affected when blades are returned to proper location.

NOTE: Ensure that blades are repositioned on disk as they were when disk and blade assembly was static balanced per Assembly-02 (Task 72-35-37-440-002).

(6) Remove PWA 85196 Retaining Ring from HPC disk.

(7) Remove all blade locks from the stage 5 disk.

(8) Wipe blade root areas to be sealed and the blade lock groove of disk by SPOP 208 Wipe Method (Task 70-21-00-110-040), prior to applying sealant.

(9) Immediately before installing each blade, apply Silicone Rubber Sealant P09-014 to the blade root as shown in Figure 1003. Coat blades thickly enough to fill in voids between blade root and disk slot when blade is in the installed position. Also, apply sealant to the blade lock groove of blades and of disk at blade locations. See Figure 1003.

(10) When a blade is assembled into the disk, hold the blade radially outward against the disk slot bearing surface, while the blade is moved to the installed position. Remove excess sealant from around the blade root area and fill in any voids.

NOTE: If disassembly is required and the sealant coating is damaged, it must be repaired before reassembly.

(11) Retain the blades by inserting the blade locks into the blade lock grooves in a clockwise direction when viewed from the front. Be sure the lock under the blade is coated with sealant to make sure lock will not roll over after sealant cure. Use the PWA 78012 Pneumatic Bender or the PWA 86518 or PWA 87128 Mechanical Bender to crimp the blade lock. These bending tools have separate jaws for initial and final bends. After making the initial bend, replace the initial bend jaw with the final bend jaw and compress handles until the blade lock is fully bent. As an option to the PWA 78012 Pneumatic Bender with separate jaws for initial and final bends, the PWA 100012 Pneumatic Bending Tool Change Letter A is used for the prebend of the blade lock and the Pneumatic Bending Tool (PWA 102146) is used for the final bend of the blade lock. No tangential motion of the lock is allowed in the installed position. Measure the bend dimension with a dial caliper. See Figure 1004.

(12) Apply Silicone Rubber Sealant P09−014 to the bent end of all blade locks. All the blade lock ends must be covered. See Figure 1004.

(13) Allow sealant to cure at room temperature and 20 percent minimum humidity for eight hours prior to the balance operation. Total curing time before engine test is 24 hours minimum. See Figure 1005.

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - DISASSEMBLY-01

Task 72-35-38-040-001:

1. Disassemble Drum Rotor And Blades (Front) Assembly

A. Prerequisites

(1) Disassemble axial compressor rotor assembly by 72-35-01, Disassembly-01 Task 72-35-01-040-001.

B. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter (2 Necessary)
PWA 85129	Support, Drum And Disk
PWA 85133	Adapter, Lift And Trunnion
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling (Optional To PWA 88643)

C. Procedure

See Figure 501.

(1) Install PWA 85133 Adapter on drum and blades assembly (longer blades up). Attach PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to spools of adapter and raise assembly from storage rack. Lower drum and blades assembly on PWA 85129 Support. Remove sling, adapter, and adapter from drum assembly. See Figure 501.

(2) Remove the 6th through 12th stage blades from the drum rotor. Refer to Disassemble (Deblade) the Axial Compressor Rotor Assembly by 72-35-01, Disassembly-20 (Task 72-35-01-040-003).

NOTE: It is not necessary to remove the 9th stage bleed air tubes from the front drum assembly.

(3) Install PWA 85133 Adapter on drum upper flange. Attach PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to spools of adapter and place drum on storage rack. Remove sling, adapters, and adapter from drum. See Figure 503.

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−01

Task 72−35−38−440−001:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12)

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 85129	Support
PWA 85133	Adapter, Lift And Trunnion
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling

B. Procedure

CAUTION: THE 9TH STAGE BLEED TUBES MUST BE INSTALLED BEFORE YOU ASSEMBLE THE HPC ROTOR ASSEMBLY. IF THE HPC DRUM IS ASSEMBLED AND THE ENGINE IS OPERATED WITHOUT THESE TUBES DAMAGE TO THE ENGINE CAN OCCUR.

(1) Examine the HPC front drum for the presence of the 9th stage HPC bleed tubes. Look for the bleed tubes just behind the 9th stage bleed ports on the OD of the drum.

(a) If the bleed tubes are not there, install the bleed tubes. If the drum rotor was refurbished, refer to 72−35−07, Repair−12 or Repair−18, PW4000 Series CIR, PN 51A357 for the applicable repair.

(b) If the drum rotor is new, refer to 72−35−38, Assembly−13 (Task 72−35−38−440−014).

(2) Put the drum rotor, rear end down, on the PWA 85129 Support. See Figure 1001.

(a) Install PWA 85133 Adapter on drum and attach PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to hoist and to spools on adapter.

(b) Raise drum from storage rack and lower drum on PWA 85129 Support, smaller OD up.

(c) Remove sling, adapters, and adapter from drum.

(3) Assemble the 12th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 12th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−24, CONFIG−1 (Task 72−35−01−440−012).

C. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11). Refer to 72−35−38, Assembly−03, CONFIG−1 (Task 72−35−38−440−003).

(Task 72-35-38-440-001)

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-01

Task 72-35-38-440-013:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12)

A. General

(1) Use one of the procedures that follow to install the 12th stage blades.

(a) Use Task 2 (Task 72-35-38-440-013-A) of this procedure to install the 12th stage blades in Pre SB PW4ENG 72-586 HPC assemblies.

(b) Use Task 3 (Task 72-35-38-440-013-B) of this procedure to install the 12th stage blades in Post SB PW4ENG 72-586 HPC assemblies.

Task 72-35-38-440-013-A:

2. Assemble Drum Rotor And Blades (Front) Assembly (Stage 12), (Pre SB PW4ENG 72-586 Only)

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 85129	Support
PWA 85133	Adapter, Lift And Trunnion
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling

B. Procedure

CAUTION: THE 9TH STAGE BLEED TUBES MUST BE INSTALLED BEFORE YOU ASSEMBLE THE HPC ROTOR ASSEMBLY. IF THE HPC DRUM IS ASSEMBLED AND THE ENGINE IS OPERATED WITHOUT THESE TUBES DAMAGE TO THE ENGINE CAN OCCUR.

(1) Examine the HPC front drum for the presence of the 9th stage HPC bleed tubes. Look for the bleed tubes just behind the 9th stage bleed ports on the OD of the drum.

(a) If the bleed tubes are not there, install the bleed tubes. If the drum rotor was refurbished, refer to 72-35-07, Repair-12 or Repair-18, PW4000 Series CIR, PN 51A357 for the applicable repair.

(b) If the drum rotor is new, refer to 72-35-38, Assembly-13 (Task 72-35-38-440-014).

(2) Put the drum rotor, rear end down, on the PWA 85129 Support. See Figure 1001.

(a) Install PWA 85133 Adapter on drum and attach PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to hoist and to spools on adapter.

(b) Raise drum from storage rack and lower drum on PWA 85129 Support, smaller OD up.

(c) Remove sling, adapters, and adapter from drum.

(3) Assemble the 12th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 12th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Pre SB PW4ENG 72-586 Only) per 72-35-01, Assembly-24, CONFIG-2 (Task 72-35-01-440-022-A).

C. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11). Refer to 72-35-38, Assembly-03, CONFIG-2 (Task 72-35-38-440-017).

Task 72-35-38-440-013-B:

3. Assemble Drum Rotor And Blades (Front) Assembly (Stage 12), (Post SB PW4ENG 72-586 Only)

A. Equipment And Materials Required

Special Tools:

PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 85129	Support
PWA 85133	Adapter, Lift And Trunnion
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling

B. Procedure

CAUTION: THE 9TH STAGE BLEED TUBES MUST BE INSTALLED BEFORE YOU ASSEMBLE THE HPC ROTOR ASSEMBLY. IF THE HPC DRUM IS ASSEMBLED AND THE ENGINE IS OPERATED WITHOUT THESE TUBES DAMAGE TO THE ENGINE CAN OCCUR.

(1) Examine the HPC front drum for the presence of the 9th stage HPC bleed tubes. Look for the bleed tubes just behind the 9th stage bleed ports on the OD of the drum.

(a) If the bleed tubes are not there, install the bleed tubes. If the drum rotor was refurbished, refer to 72-35-07, Repair-12 or Repair-18, PW4000 Series CIR, PN 51A357 for the applicable repair.

(b) If the drum rotor is new, refer to 72-35-38, Assembly-13 (Task 72-35-38-440-014).

(2) Put the drum rotor, rear end down, on the PWA 85129 Support. See Figure 1001.

(a) Install PWA 85133 Adapter on drum and attach PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to hoist and to spools on adapter.

(b) Raise drum from storage rack and lower drum on PWA 85129 Support, smaller OD up.

(c) Remove sling, adapters, and adapter from drum.

(3) Assemble the 12th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 12th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72-586 Only) per 72-35-01, Assembly-24, CONFIG-2 (Task 72-35-01-440-022-B).

C. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11). Refer to 72-35-38, Assembly-03, CONFIG-2 (Task 72-35-38-440-017).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-02

Task 72-35-38-440-002:

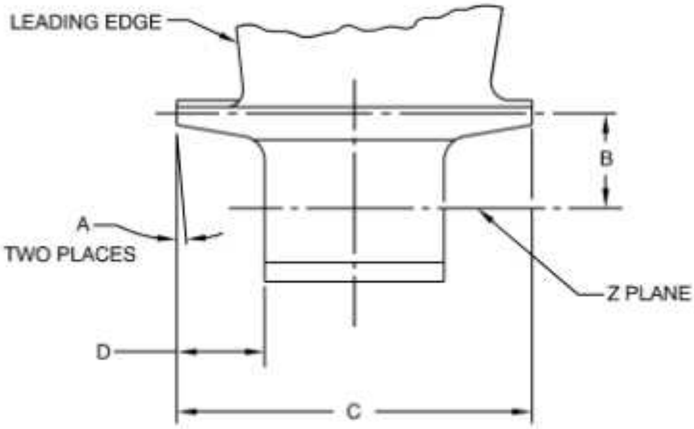
1. Grind Stage 9 Through 12 HPC Blade Platforms
   A. Equipment And Materials Required

      Special Tools:
      PWA 17019 Holder
      PWA 85597 Fixture, Grinding (9th Stage)
      PWA 85598 Fixture, Grinding (10th Stage)
      PWA 85599 Fixture, Grinding (11th Stage)
      PWA 85600 Fixture, Grinding (12th Stage)
      PWA 101965 Fixture, Grinding (12th Stage)

   B. Procedure
      See Figure 1001 and 1002.
      (1) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
      Before you install the blades into the fixture, measure the platform of all of the blades. Refer to Figure 1001.
         (a) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
         The blade platform width must be equal to or greater than the Dimension C shown in Figure 1001. Blades which are less than the minimum value shown in the specified figure must be removed from service.
         (b) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
         You can install and grind blades with equal platform width together (Dimensions C and D).
         (c) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
         You can install and grind blades with equal platform widths separately (Dimensions C and D).
         (d) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
         You must maintain the platform dimensions shown in Figure 1001 after all grinding is completed.
      (2) FOR THESE MODELS: 4152, 4156A, 4158
      Install and secure PWA 85597 (for 9th stage) or PWA 85598 (for 10th stage) or PWA 85599 (for 11th stage) or PWA 85600 (for 12th stage) Fixture to surface plate of a surface grinding machine.

      CAUTION: FOR THESE MODELS: 4152, 4156A, 4158
      MAXIMUM MATERIAL REMOVAL PER PLATFORM SIDE MUST NOT EXCEED 0.005 INCH (0.127 mm).

      (3) FOR THESE MODELS: 4152-3, 4156A-3, 4158-3
      Install and secure PWA 85597 (for 9th stage) or PWA 85598 (for 10th stage) or PWA 85599 (for 11th stage) or PWA 101965 (for 12th stage) Fixture to surface plate of a surface grinding machine.



BLADE PLATFORM AREA
FRONT VIEW

STAGE	A±0° 30'	B GAGE	C MINIMUM*	D MINIMUM*
9	2° 44'	0.349 inch (8.865mm)	1.112 inch (28.245mm)	0.273 inch (6.934mm)
10	2° 54'	0.303 inch (7.696mm)	1.192 inch (30.277mm)	0.293 inch (7.442mm)
11	2° 39'	0.295 inch (7.493mm)	1.091 inch (27.711mm)	0.268 inch (6.807mm)
12	2° 30'	0.294 inch (7.468mm)	1.029 inch (26.137mm)	0.246 inch (6.248mm)
13	2° 18'	0.291 inch (7.391mm)	0.9485 inch (24.092mm)	0.231 inch (5.867mm)
14	2° 34'	0.291 inch (7.391mm)	0.9730 inch (24.714mm)	0.238 inch (6.045mm)
15	2° 34'	0.288 inch (7.315mm)	1.058 inch (26.875mm)	0.258 inch (6.553mm)

*NOTE: BLADES CANNOT BE GROUND BEYOND THESE LIMITS.

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-02

CAUTION: FOR THESE MODELS: 4152-3, 4156A-3, 4158-3 MAXIMUM MATERIAL REMOVAL PER PLATFORM SIDE MUST NOT EXCEED 0.005 INCH (0.127 mm).

(4) Install blade Types D or A, if applicable, into fixture and secure. Grind required amount of material from blade platform. Each blade must have an equal amount of material removed. On any one blade, material removed must be in approximately equal amounts from both sides of platform.

(5) Remove blade from fixture and reinstall with ground platform down. Grind other platform to required amount removed from first grind. Remove blade from fixture. Blades with trimmed platforms must be identified with a square symbol in the time marking area. Use vibration peening as the marking method. See 70-11, Standard Practices Manual.

(6) Grind remaining blade platforms as required per previous instructions.

(7) Measure platform width using PWA 17019 Holder. If blade needs additional grinding repeat above steps. If blade is acceptable continue with procedure in Assembly-01 (Task 72-35-38-440-001) or Assembly-03 (Task 72-35-38-440-003) or Assembly-04 (Task 72-35-38-440-004) or Assembly-05 (Task 72-35-38-440-005).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−03

Task 72−35−38−440−003:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12). Refer to 72−35−38, Assembly−01, CONFIG−1 (Task 72−35−38−440−001).

B. Equipment And Materials Required − None

C. Procedure

(1) Assemble the 11th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 11th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−25, CONFIG−1 (Task 72−35−01−440−013).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10). Refer to Assembly−04, CONFIG−1 (Task 72−35−38−440−004).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−03

Task 72−35−38−440−017:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 12). Refer to Assembly−01, CONFIG−2 (Task 72−35−38−440−013).

B. Equipment And Materials Required − None

C. Procedure

(1) Assemble the 11th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 11th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−25, CONFIG−2 (Task 72−35−01−440−023).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10). Refer to Assembly−04, CONFIG−2 (Task 72−35−38−440−016).

Previous Pageblock Return to Previous Menu Next Pageblock

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−04

Task 72−35−38−440−004:

1. Assemble Drum Rotor And Blades (Front) Assembly (Stage 10)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11). Refer to 72−35−38, Assembly−03, CONFIG−1 (Task 72−35−38−440−003).

B. Equipment And Materials Required − None

C. Procedure

(1) Assemble the 10th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 10th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−26, CONFIG−1 (Task 72−35−01−440−014).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 9). Refer to 72−35−38, Assembly−05, CONFIG−1 (Task 72−35−38−440−005).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-04

Task 72-35-38-440-016:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 11). Refer to 72-35-38, Assembly-03, CONFIG-2 (Task 72-35-38-440-017).

B. Equipment And Materials Required - None

C. Procedure

(1) Assemble the 10th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble 10th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-26, CONFIG-2 (Task 72-35-01-440-024).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 9). Refer to 72-35-38, Assembly-05, CONFIG-2 (Task 72-35-38-440-015).

Previous Pageblock Return to Previous Menu Next Pageblock

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−05

Task 72−35−38−440−005:

1. Assemble Drum Rotor And Blades (Front) Assembly (Stage 9)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10). Refer to 72−35−38, Assembly−04, CONFIG−1 (Task 72−35−38−440−004).

B. Equipment And Materials Required − None

C. Procedure

(1) Assemble the 9th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 9th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−27, CONFIG−1 (Task 72−35−01−440−015).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 8). Refer to 72−35−38, Assembly−06 (Task 72−35−38−440−006).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-05

Task 72-35-38-440-015:

1. Assemble The Drum Rotor And Blades (Front) Assembly (Stage 9)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 10). Refer to 72-35-38, Assembly-04, CONFIG-2 (Task 72-35-38-440-016).

B. Equipment And Materials Required - None

C. Procedure

(1) Assemble the 9th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 9th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-27, CONFIG-2 (Task 72-35-01-440-025).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 8). Refer to 72-35-38, Assembly-06 (Task 72-35-38-440-006).

Previous Pageblock Return to Previous Menu Next Pageblock

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−06

Task 72−35−38−440−006:

1. Assemble Drum Rotor And Blades (Front) Assembly (Stage 8)

   A. Prerequisites

      (1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 9). Refer to 72−35−38, Assembly−05, CONFIG−1 (Task 72−35−38−440−005) or Assembly−05, CONFIG−2 (Task 72−35−38−440−015).

   B. Equipment And Materials Necessary − None

   C. Procedure

      (1) Assemble the 8th stage blades and attaching parts in the drum rotor.

         (a) Refer to Assemble The 8th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−28, (Task 72−35−01−440−016).

   D. Postrequisites

      (1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 7). Refer to 72−35−38, Assembly−07 (Task 72−35−38−440−007).

Previous Pageblock Return to Previous Menu Next Pageblock

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-07

Task 72-35-38-440-007:

1. Assemble Drum Rotor And Blades (Front) Assembly (Stage 7)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 8). Refer to 72-35-38, Assembly-06 (Task 72-35-38-440-006).

B. Equipment And Materials Necessary

Special Tools:

PWA 76154	Adapter, Lift And Trunnion (2 Necessary)
PWA 85133	Adapter, Lift And Trunnion
PWA 88643	Sling, Lifting (Optional to PWA 88673)
PWA 88673	Sling, Lifting (Optional to PWA 88643)

C. Procedure

(1) Assemble the 7th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 7Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-29 (Task 72-35-01-440-017).

(2) Attach PWA 85133 Adapter to the front flange of the drum rotor. Use a hoist with PWA 88643 Sling or PWA 88673 Sling and two PWA 76154 Adapters to lift the drum rotor.

(3) Move drum rotor adjacent to oven for sealant curing. Lower rotor onto suitable support. Remove sling, adapters and adapter from drum rotor.

(4) Cure the blade root sealant.

(a) Refer to Assemble The 7Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-29 (Task 72-35-01-440-017).

(5) After curing remove rotor from oven and allow to air cool to room temperature.

D. Postrequisites

(1) Assemble The Drum Rotor And Blades Assembly (Stage 6). Refer to 72-35-38, Assembly-08 (Task 72-35-38-440-008).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-08

Task 72-35-38-440-008:

1. Assemble Drum Rotor And Blades Assembly (Stage 6)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Front) Assembly (Stage 7). Refer to 72-35-38, Assembly-07 (Task 72-35-38-440-007).

B. Equipment And Materials Required - None

C. Procedure

(1) Assemble the 6th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 6th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-30 (Task 72-35-01-440-018).

D. Postrequisites

(1) Assemble The Axial Compressor Rotor Assembly. Refer to 72-35-01, Assembly-01 (Task 72-35-01-440-001).

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-09

Task 72-35-38-440-009:

1. Assemble Drum Rotor And Blades (Front) Assembly For Balance

This Procedure Has Been Deleted

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY - ASSEMBLY-10

Task 72-35-38-440-012:

1. Seal Drum Rotor And Blades Assembly (Stage 6)

This Procedure Has Been Deleted

DRUM ROTOR AND BLADES (FRONT) ASSEMBLY − ASSEMBLY−13

Task 72−35−38−440−014:

1. Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front)

A. General

(1) Use one of the procedures that follow to install the 9th stage bleed air tubes to a new drum rotor (front) only.

(a) Use Task 72−35−38−440−014−A of this procedure to install the 9th stage bleed air tubes (flared tube end type) to a new drum rotor.

(b) Use Task 72−35−38−440−014−B of this procedure to install the 9th stage bleed air tubes (flared tube stop type) to a new drum rotor.

Task 72−35−38−440−014−A:

2. Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front) (Flared Tube End Type)

A. Equipment And Materials Necessary

Standard Tools:

Name	Manufacture
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60658

Special Tools:

PWA 84866	Expander, Tube
PWA 85815	Mandrel, Forming (Optional to PWA 84866)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tube Assembly	24	72−35−00/1/160

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine
P06−009	Compound, Antiseize

B. Procedure

(1) Put the tubes in sequence (by weight) in four columns of six rows. See Table 1001.

	COLUMN			
ROW	I	II	III	IV
1	HEAVIEST −−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−−>			
2	<−−−			
3	−−−>

2	2	8	14	20
3	3	9	15	21
4	4	10	16	22
5	5	11	17	23
6	6	12	18	24

Tube Sequence Marking
Table 1002

(4) Make a sequence mark in ink on the drum rotor. Start at any hole and mark it number one.

(5) Mark remaining holes 2 through 24 in a clockwise direction.

(6) Install tubes into ID of drum. Align number on tube with number on drum.

(7) Mix 2/3 volume of Compound P06−009 and 1/3 volume of Engine Oil P03−001.

(8) Apply the mixture to ID of the tube at the OD end. Apply the mixture to the PWA 84866 Mandrel or PWA 85815 Mandrel flare detail.

(9) Lubricate the threads of the tool with Engine Oil P03−001.

(10) Install the shaft of the mandrel (PWA 84866 or PWA 85815) through the No. 1 tube from the ID of the drum rotor. Install flare over shaft and secure with the nut assembly.

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IT WILL CAUSE DAMAGE TO THE PART.

(11) Start at the No. 1 Position and from the outside of the drum, heat the hole and the installed tube to 225° − 275°F (107° − 135°C). Do not exceed 300°F (149°C) on any part.

(12) Hold the ID of the tool with a wrench and turn the OD nut to flare the tube into the drum rotor.

(13) Do the same procedure to install the remaining tubes in the following sequence until all the tubes have been flared.

1, 13, 2, 14, 3, 15 ....11, 23, 12, 24

(14) When the flaring operation is complete and the tubes are cool, examine the flare on the 9 stage bleed tubes as follows. See Figure 1001.

(a) From the outside of the drum, push each tube in as far as the tube will move. Measure the distance from the flared end of the tube to the outside surface of the drum. The distance can be 0.040 inch (1.016 mm) maximum.

(b) From the inside of the drum, push each tube out as far as the tube will move. Make sure the tube is flush to below the outer surface of the drum.

(c) For tubes that are not in the limits given above, do the flaring operation again.

(15) Do a fluorescent penetrant inspection on the flared area of the tube. See SPOP 82 (Task 70−33−00−230−005), Standard Practices Manual, PN 585005. Replace the tube when you find cracks.

Task 72−35−38−440−014−B:

3. Assemble 9th Stage Bleed Air Tubes To The Drum Rotor (Front) (Flared Tube Stop Type)

A. Equipment And Materials Necessary

Special Tools:

PWA 87482	Expander, Manual
PWA 87493	Drift, Hand

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Tube Assembly, Bleed Stage 9	24	72−35−00/1/160A

B. Procedure

(1) Install the tubes to the drum rotor as follows:

(a) Put the 24 tubes in sequence (by weight) in four columns of six rows. See Table 1003.

(b) Put the heaviest tube first. Continue until all tubes are used. The last tube is the lightest.

(c) Make a sequence mark in ink on the tubes. See Table 1004.

(d) Make a sequence mark in ink on the drum rotor. Start at any hole and mark it number one.

(e) Mark remaining holes 2 through 24 in a clockwise direction.

5	5	11	17	23
6	6	12	18	24

Tube Sequence Marking
Table 1004

(2) Install the tube assemblies in their appropriate position in the ID of the drum.

(a) With the bleed tube positioned correctly in the drum rotor, install a PWA 87482 Expander into the threads of the stop detail.

(b) Turn the tool detail coupling nut until the stop is correctly flared into position and the tube is held tight. See Figure 1002.

1 Diameter of the flare opening must be as shown in the figure.

2 The flare must not have cracks.

(c) Repeat the steps above until all tubes are installed.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - DISASSEMBLY-01

Task 72-35-39-040-001:

1. Disassemble Drum Rotor And Blades (Rear) Assembly

A. Prerequisites

(1) Disassemble axial compressor rotor assembly by 72-35-01, Disassembly-01 Task 72-35-01-040-001.

B. Equipment And Materials Required

Special Tools:

PWA 29389 Pump, Hand
PWA 76154 Adapter (2 Necessary)
PWA 85086 Lift Arm
PWA 85124 Adapter, Lift
PWA 85127 Adapter, Lift And Trunnion
PWA 85129 Support
PWA 85159 Protector, Thread
PWA 85801 Puller, Airseal
PWA 86221 Puller, Hydraulic
PWA 88643 Sling (Optional to PWA 88673)
PWA 88673 Sling
PWA 102107 Pusher, Manual

C. Procedure

(1) With drum rotor and blades (rear) assembly (hub end down) in Support PWA 85125 remove spiral retaining ring from hub ID.

(2) Install PWA 86221 Puller jaws in the heat shield puller groove. Turn adjustable nut to move jaws into puller groove. Install plate and hydraulic ram and secure. See Figure 501.

(3) Install PWA 29389 Hand Pump and actuate puller to remove heat shield. Remove puller from drum rotor and blades.

(4) Remove 42 tierods from drum using PWA 102107 Pusher. See Figure 502.

(5) Install PWA 85127 Adapter to flange end of rear drum. Attach PWA 88643 or PWA 88673 Sling with PWA 76154 Adapters to spools on adapter on rear drum. Attach hoist and lift assembly out of support. See Figure 503.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − DISASSEMBLY−01

(6) Install PWA 85124 Adapter to hub threads. Attach PWA 85086 Lift Arm to installed adapter. Attach hoist and trunnion drum rotor to hub end up.

(7) Remove hoist, sling, adapters and adapter from drum rotor. Lower drum rotor down onto PWA 85129 Support. Remove hoist, adapter and lift arm from hub.

(8) Remove diffuser airseal as follows. See Figure 504.

  (a) Remove 50 bolts and nuts which attaches airseal to the hub.

  (b) Position PWA 85801 Puller locator over the end of the hub.

  (c) Position jaws of the puller over and in front of the largest diameter of the airseal knife edge.

  (d) Position retaining ring over jaws and remove airseal with PWA 29389 Pump.

  (e) Remove puller. Remove damper from airseal.

(9) Install PWA 85159 Protector to hub threads.

(10) Remove the 13th through 15th stage blades from the drum rotor.

  (a) Refer to Disassemble (Deblade) The Axial Compressor Rotor Assembly per 72−35−01, Disassembly−20 (Task 72−35−01−040−003).

(11) Remove protector from hub threads and install Adapter PWA 85124. Attach PWA 85086 Lift Arm to installed adapter and attach hoist. Raise drum rotor from support.

(12) Place drum rotor on storage rack. Remove hoist, adapter, and lift arm. Install Protector PWA 85159 to hub threads. Install protective covers to all airseals.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − DISASSEMBLY−01

Task 72−35−39−040−002−001:

1. Disassemble The Drum Rotor And Blades (Rear) Assembly (Rear Shaft Removal Method 1)

A. Prerequisites

(1) Disassemble axial compressor rotor assembly by 72−35−01, Disassembly−01 (Task 72−35−01−040−001).

B. Equipment And Materials Necessary

Special Tools:

PWA 29389	Pump, Hand
PWA 76154	Adapter (4 Necessary)
PWA 85086	Lift Arm
PWA 85124	Adapter, Lift
PWA 85125	Support, Drum Rotor
PWA 85127	Adapter, Lift And Trunnion
PWA 85159	Protector, Thread
PWA 86221	Puller, Hydraulic
PWA 87180	Puller, Hydraulic
PWA 87192	Puller, Jackscrew
PWA 87194	Fixture, Handling
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling
PWA 88700	Adapter, Lift
PWA 88723	Puller, Hydraulic
PWA 101610	Spreader
PWA 102107	Pusher, Manual

C. Procedure
See Figure 501, Figure 502, Figure 503, Figure 504 and Figure 505.

(1) Attach PWA 85127 Lift And Trunnion Adapter to front face of rear drum. Use PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to raise the drum rotor and blades (rear) assembly. Remove 50 tiebolt nuts and bolts that attach the HPC shaft to the HPC rear drum rotor. Install PWA 101610 Spreader into the HPC tiebolt retaining clips to spread the clips outward. Push the tiebolt through the clip and remove the
R tiebolts from the retaining clips. Discard the
R retaining clips. It is not permitted to use the 50 tiebolts or tiebolt nuts again. The 50 tiebolts and tiebolt nuts must be discarded.

(2) Install the drum rotor and blades (rear) assembly to the PWA 85125 Support, shaft end down. Remove the adapter. Remove the spiral retaining ring that holds the No. 3 bearing heat shield. (Pre SB PW4ENG 72−562) Install the PWA 86221 Hydraulic Puller to the front flange and connect the PWA 29389 Hand Pump. (Post SB PW4ENG 72−562) Install the PWA 87180 Hydraulic Puller to the front flange and connect the PWA 29389 Hand Pump. Actuate the puller to remove the No. 3 bearing heat shield.

(3) Use PWA 102107 Pusher and remove the 42 tierods from the drum rotor. See Figure 502.

(4) Install the PWA 88723 Hydraulic Puller to the front flange of the HPC rear drum and use PWA 29389 Hand Pump to disengage the rear shaft from the rear drum.

(5) Remove puller and attach PWA 85127 Lift And Trunnion Adapter and PWA 76154 Adapters to front face of rear drum. Raise rear drum, attach PWA 87194 Handling Fixture and PWA 76154 Adapters to rear face of rear drum. Lift rear drum and trunnion so that it can be placed, front face down, on work table.

(6) Install PWA 87194 Handling Fixture on front face of rear shaft flange. (Pre SB PW4ENG 72−562) Raise shaft and attach PWA 85124 Lift Adapter and PWA 85086 Lifting Arm on threads at rear end of shaft. (Post SB PW4ENG 72−562) Raise the shaft and attach the PWA 88700 Lift Adapter and the PWA 85086 Lifting Arm on the threads at rear end of the shaft. Trunnion shaft and place on work table flange end down. See Figure 505.

(7) Install PWA 87192 Jackscrew Puller and remove the diffuser airseal from the HPC shaft as follows:

    (a) Install the puller to the HPC shaft.

    (b) Engage the four pullers to the airseal.

    (c) Turn the four hex head screw details equally to remove the airseal from the shaft.

    (d) Remove the puller from the HPC shaft. Remove the damper from the airseal.

(8) Install PWA 85159 Protector to hub threads.

(9) Remove the 13th through 15th stage blades from the drum rotor.

(a) Refer to Disassemble (Deblade) The Axial Compressor Rotor Assembly per 72-35-01, Disassembly-20 (Task 72-35-01-040-003).

(10) Place drum rotor on storage rack. Remove hoist, adapter, and lift arm. Install protective covers to all airseals.

Task 72-35-39-040-002-002:

2. Disassemble Drum Rotor And Blades (Rear) Assembly (Rear Shaft Removal Method 2)

A. Prerequisites

(1) Disassemble axial compressor rotor assembly by 72-35-01, Disassembly-01 (Task 72-35-01-040-001).

(2) Remove the 13th through 15th stage blades from the drum rotor. Refer to Disassemble (Deblade) The Axial Compressor Rotor Assembly by 72-35-01, Disassembly-20 (Task 72-35-01-040-003).

B. Equipment And Materials Necessary

Special Tools:

PWA 29389	Pump, Hand
PWA 76154	Adapter (4 Necessary)
PWA 85086	Arm, Lift
PWA 85124	Adapter, Lift
PWA 85125	Support, Drum Rotor
PWA 85127	Adapter, Lift And Trunnion
PWA 85159	Protector, Thread
PWA 86221	Puller, Hydraulic
PWA 87180	Puller, Hydraulic
PWA 87192	Puller, Jackscrew
PWA 87211	Puller, Hydraulic
PWA 88643	Sling (Optional To PWA 88673)
PWA 88673	Sling
PWA 88700	Adapter, Lift
PWA 101610	Spreader
PWA 102107	Pusher, Manual

(Task 72-35-39-040-002-001)

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − DISASSEMBLY−01

(1) Attach the PWA 85127 Lift And Trunnion Adapter to the front face of the rear drum. Use PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to raise the drum rotor (rear) assembly and install the drum rotor (rear) assembly to the PWA 85125 Support, shaft end down. Remove the adapter.

(2) Remove the spiral retaining ring that holds the No. 3 bearing heat shield. (Pre SB PW4ENG 72−562) Install the PWA 86221 Hydraulic Puller to the front flange and connect the PWA 29389 Hand Pump. (Post SB PW4ENG 72−562) Install the PWA 87180 Hydraulic Puller to the front flange and connect the PWA 29389 Hand Pump. Actuate the puller to disengage the No. 3 bearing heat shield. Remove the puller and heat shield from the drum rotor. See Figure 506.

(3) Use the PWA 102107 Pusher and remove the 42 tierods from the drum rotor front face. See Figure 507.

(4) Attach the PWA 85127 Lift And Trunnion Adapter and PWA 76154 Adapters to the front face of rear drum.

(5) (Pre SB PW4ENG 72−562) Raise the drum rotor and shaft and attach the PWA 85124 Lift Adapter and PWA 85086 Lifting Arm on the threads at the rear end of the shaft. (Post SB PW4ENG 72−562) Raise the drum rotor and shaft and attach the PWA 88700 Lift Adapter and the PWA 85086 Lifting Arm on the threads at the end of the shaft. Trunnion the drum rotor and shaft to the front flange down on a suitable pallet. Remove the Lifting Arm (PWA85086). See Figure 508.

(6) Remove the 50 tiebolt nuts that attach the HPC shaft to the HPC rear drum rotor. It is not permitted to use the 50 tiebolt nuts again. The 50 tiebolt nuts must be discarded.

(7) Install the PWA 87211 Hydraulic Puller, with a three cable sling, over the Lift Adapter and the Lifting Arm to the HPC rear drum so that the Puller is positioned on the HPC 15th stage knife edge seal and the puller body assembly is centered on the No.3 bearing shoulder of the HPC rear shaft.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − DISASSEMBLY−01

(8) Connect the PWA 29389 Hydraulic Pump to the Puller (PWA 87211) and actuate to raise the body of the puller so that the detail clamps can be positioned under the front face of the rear shaft. Lock the 12 clamps in position and actuate the hydraulic pump until the rear shaft disengages from the drum rotor.

(9) Release the pressure from the puller and retract the 12 detail clamps from under the front face of the rear shaft. Carefully remove the Puller (PWA 87211) from the drum rotor. Make sure the rear shaft is still partially engaged by the tierod bolts.

(10) Install the Lifting Arm (PWA 85086) to the Lift Adapter (PWA85124 or PWA 88700). Attach a hoist to the Lifting Arm (PWA 85086) and remove the rear shaft from the drum rotor. Place the rear shaft on a suitable pallet and remove the tooling.

(11) Install PWA 87192 Jackscrew Puller and remove the diffuser airseal from the HPC shaft as follows:

  (a) Install the puller to the HPC shaft.

  (b) Engage the four pullers to the airseal.

  (c) Turn the four hex head screw details equally to remove the airseal from the shaft.

  (d) Remove the puller from the HPC shaft. Remove the damper from the airseal.

(12) Install PWA 85159 Protector to the shaft threads.

(13) Remove the 50 tiebolts from the HPC rear drum rotor that attach the HPC shaft. Install PWA 101610 Spreader into the HPC tiebolt retaining clips to spread the clips outward. Push the tiebolt through the clip and remove the tiebolts from the retaining clips and the rear drum. Discard the retaining clips. It is not permitted to use the 50 tiebolts again. The 50 tiebolts must be discarded.

(14) Place the drum rotor on a storage rack. Remove the hoist and the adapter. Install protective covers to all airseals.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01

Task 72−35−39−440−001:

1. Install No. 3 Bearing Heat Shield

A. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Special Tools:

PWA 29754	Control, Heater
PWA 76154	Adapter (2 Necessary)
PWA 85086	Lift Arm (2 Necessary)
PWA 85124	Adapter, Lift
PWA 85125	Support, Drum Rotor
PWA 85126	Drift, Hand
PWA 85127	Adapter, Lift And Trunnion
PWA 85129	Support Drum And Disk
PWA 85312	Heater, Airseal (Optional)
PWA 85428	Protector, Plastic (Optional)
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling (Optional to PWA 88643)

Consumable Material:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)

B. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled.Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure.However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

C. Procedure

(1) Install PWA 85124 Adapter to hub threads. Attach PWA 85086 Lift Arm to installed adapter. Using hoist attached to arm, raise drum rotor from storage rack and install on PWA 85129 Support. See Figure 1001.

(2) Remove hoist, arm, and adapter from hub.

(3) Install PWA 85312 Heater to rest on hub seal flange. Using PWA 29754 Controller, heat flange to temperature not to exceed 300°F (148°C). See Figure 1002.

(4) When temperature of seal flange is achieved shut off heater and remove from rear hub. Install airseal, with damper to hub flange, aligning bolt holes. Allow area to cool to touch.

(5) Install heat shield into freezer and chill for approximately 20 minutes.

(6) Install 50 bolts, threads lubricated with Engine Oil P03−001 and nuts. Install bolts, heads up, and tighten and torque nuts to 85 − 95 lb−in. (9.604 − 10.734 N.m). Install PWA 85428 Protector on airseal.

(7) Reinstall PWA 85124 Adapter to hub threads. Attach PWA 85086 Lift Arm to installed adapter. Using hoist attached to lift arm raise drum rotor from support.

(8) Install PWA 85127 Adapter to flange end (bottom) of rear drum. Attach hoist and PWA 88643 Sling or PWA 88673 Sling with PWA 76154 Adapters to spools on adapter. Trunnion, drum rotor to hub end down. Remove hoist, lift arm and adapter from hub. See Figure 1003.

(9) Lower drum rotor into PWA 85125 Support. Remove hoist, sling, adapters and adapter from drum rotor. See Figure 1004.

(10) Install chilled heat shield into ID of rear drum. Align tabs of heat shield with slots in drum. Using PWA 85126 Drift and mallet seat heat shield in rear drum.

(11) Install retaining ring into groove in rear drum to retain heat shield.

D. Postrequisites

(1) Assemble drum rotor and blades (rear) assembly (Stage 13) by Assembly−02 Task 72−35−39−440−002.

Task 72−35−39−440−001−A:

1. Install No. 3 Bearing Heat Shield, Rear Shaft And Diffuser Airseal − Drum Rotor And Blades (Rear) Assembly (Pre SB PW4ENG 72−562)

A. Equipment And Materials Necessary

Special Tools:

PWA 12632	Nut
PWA 12633	Hydraulic Ram
PWA 29754	Control, Heater
PWA 76154	Adapter (2 Necessary)
PWA 85086	Lift Arm
PWA 85124	Adapter, Lift
PWA 85125	Support, Drum Rotor
PWA 85126	Drift, Hand
PWA 87179	Drift, Hand
PWA 87200	Heater
PWA 87193	Pusher, Hydraulic
PWA 87194	Handling Fixture
PWA 87379	Fixture, Angle Of Turn
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling (Optional to PWA 88643)
PWA 88700	Adapter, Lift

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−102	Dry Ice

B. General Assembly Requirements

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01

(1) Where heating is necessary for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

C. Procedure
See Figures 1001, 1002 and 1003.

(1) Place No. 3 bearing heat shield in freezer and chill for approximately 20 minutes.

(2) Attach the PWA 87194 Handling Fixture to the front end flange of the HPC rear shaft. Attach PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to the PWA 87194 Fixture. Lift and trunnion the assembly, smaller end down. Install the shaft to the PWA 85125 Support. Remove the sling and PWA 87194 Handling Fixture. Find the high point runout symbol (triangle within a circle) and make a line mark with ink on the slanted surface closest to the tierod hole in line with it.

(3) Install chilled No. 3 bearing heat shield into ID of rear shaft. (Pre SB PW4ENG 72-562) Align tabs of heat shield with slots in shaft ID and seat heat shield in rear shaft with the use of PWA 85126 Drift. (Post SB PW4ENG 72-562) Align tabs of heat shield with slots in shaft ID and seat heat shield in rear shaft with the use of PWA 87179 Drift. Install the spiral retaining ring to the groove above the heat shield.

(4) Place diffuser airseal on work bench, smaller diameter up. Install the damper to the ID of the diffuser airseal. Find the unbalance symbol (triangle with unbalance value) on bolt hole flange. Locate bolt hole approximately 180 degrees opposite unbalance symbol and place ink mark on flange in line with that bolt hole.

(5) Set the diffuser airseal on Dry Ice P05−102 in the dry ice chest for a minimum of 25 minutes. Set the airseal so that the damper on the ID of the seal will not move.

(6) Attach PWA 87194 Handling Fixture to rear flange of rear drum. Lower the drum, front flange down, to PWA 87193 Hydraulic Pusher base detail and remove handling fixture. Locate the high point runout symbol (triangle within a circle). Locate bolt hole approximately 180 degrees opposite the high point runout symbol and place ink mark on slanted surface near tierod holes.

(7) Put PWA 87200 Heater on work table. Attach PWA 87194 Handling Fixture to front flange end of HPC rear shaft. (Pre SB PW4ENG 72−562) Raise the shaft so that PWA 85124 Adapter can be installed on threads at smaller end of shaft. (Post SB PW4ENG 72−562) Raise the shaft so that the PWA 88700 Adapter can be installed on the threads at the smaller end of the shaft. Install PWA 85086 Lift Arm to adapter and hoist. Trunnion assembly, large diameter down and remove handling fixture. See Figure 1002.

CAUTION: SHAFT TEMPERATURE MUST NOT EXCEED 300°F (148.9°C).

(8) Lower shaft onto PWA 87200 Heater, resting shaft front flange onto plate inside heater ID. Heat shaft front flange to 275° − 300°F (135° − 149°C).

(9) Install retaining clips under rear flange of rear drum at all bolt holes, with radius edge inside drum ID groove. Install new tierods (head down) through the clip and bolthole. Push the tierods upward to snap into clip. Lightly lube the tierod threads with Engine Oil P03−001 or Antiseize Compound P06−054 and remove the unwanted lubricant or excess antiseize compound.

NOTE: Do not engine oil to mix with PWA 36246 antiseize paste, testing has shown that it reduces the effectiveness of the antiseize paste as assembly lubricant.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01

CAUTION: WHEN SHAFT ASSEMBLY IS LOWERED ONTO REAR DRUM, TAKE EXTREME CARE NOT TO PUSH TIERODS (INSTALLED IN REAR DRUM) OUT OF POSITION.

(10) After shaft front flange reaches 270° − 300°F (132° − 149°C), remove from heater and lower onto rear drum, aligning ink marks and tierods with tierod holes until mating flanges contact each other. Remove hoist and adapters.

(11) Install threaded rod to the pusher base detail of PWA 87193 Hydraulic Pusher. Install the plate detail of PWA 87193 Hydraulic Pusher over the rod to set on the end of the shaft. Install PWA 12633 Hydraulic Ram and attach with the nut. Apply a hydraulic pressure of 3000 psi (20684.3 kPa) to the ram and keep this pressure until the shaft has cooled to approximately 70°F (21.1°C). Remove the press tooling.

(12) Locate shaft unbalance symbol (triangle with unbalance value), marked on upper flange OD of shaft. Ink mark face of tierod which is closest to the unbalance symbol.

(13) Remove airseal from freezer and install over shaft, large diameter down, aligning line on airseal with ink marked tierod. Use a nylon drift, tap airseal to seat.

NOTE: Exercise care not to push tierods out of position while installing airseal.

(14) Lightly lube the tierod threads with Engine Oil P03−001 or Antiseize Compound P06−054 and remove the unwanted lubricant or excess antiseize compound. Install four washers and new tierod nuts at approximately 90 degrees apart and, in an alternating pattern (first the tierod nut at the 90 degree location, then 180, then 270, then 360), tighten the tierod nuts to seat. Next install additional washers and new tierod nuts at approximately the 45, 135, 225 and 315 degree location. In an alternating pattern, tighten the tierod nuts to seat. Install the remaining new tierod nuts and washers and tighten to seat.

NOTE: Do not engine oil to mix with PWA 36246 antiseize paste, testing has shown that it reduces the effectiveness of the antiseize paste as assembly lubricant.

(15) (Reference 1561) Install PWA 87379 Torque Fixture. Apply torques as follows, use an alternating sequence as marked on the index plate of torque fixture.

(a) Apply initial torque of 240 - 260 lb-in. (27.116 - 29.376 N.m) to all 50 nuts.

(b) Using same sequence, loosen nuts. Check prevailing (run-on) torque.

NOTE: Prevailing torque must be a minimum of 9.5 lb-in. (1.073 N.m) or a maximum of 40 lb-in. (4.519 N.m). If prevailing torque limits are not met, replace nut.

(c) Torque nuts to 20 - 30 lb-in. (2.260 - 3.390 N.m) plus the prevailing torque.

(d) Apply 98 - 102 degrees angle of turn, while monitoring torque with torque wrench. Final torque value must not exceed 700 lb-in. (79.089 N.m). If final torque exceeds this maximum, replace nut and bolt.

D. Postrequisites

(1) Assemble drum rotor and blades (rear) assembly (Stage 13) by Assembly-02 Task 72-35-39-440-002.

Task 72-35-39-440-001-B:

2. Install No. 3 Bearing Heat Shield, Rear Shaft And Diffuser Airseal - Drum Rotor And Blades (Front And Rear) Assembly (Post SB PW4ENG 72-562)

A. Equipment And Materials Necessary

Special Tools:

PWA 12632	Nut
PWA 12633	Hydraulic Ram
PWA 29754	Control, Heater
PWA 76154	Adapter (2 Necessary)
PWA 85125	Support, Drum Rotor
PWA 87179	Drift, Hand
PWA 87200	Heater
PWA 87193	Pusher, Hydraulic
PWA 87194	Handling Fixture
PWA 87379	Fixture, Angle Of Turn
PWA 88643	Sling (Optional to PWA 88673)

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01

Special Tools:

(CONTINUED)

PWA 88673	Sling (Optional to PWA 88643)
PWA 88712	Pusher, Hydraulic

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narraganset Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−102	Dry Ice

B. General Assembly Requirements

(1) Where heating is necessary for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

C. Procedure
See Figures 1004, 1005, 1006 and 1007.

(1) Place No. 3 bearing heat shield in freezer and chill for approximately 20 minutes.

(2) Attach the PWA 87194 Handling Fixture to the front end flange of the HPC rear shaft. Attach PWA 88643 Sling or PWA 88673 Sling and PWA 76154 Adapters to the PWA 87194 Fixture. Lift and trunnion the assembly, smaller end down. Install the shaft to the PWA 85125 Support. Remove the sling and PWA 87194 Handling Fixture. Find the high point runout symbol (triangle within a circle) and make a line mark with ink on the slanted surface closest to the tierod hole in line with it.

(3) Install chilled No. 3 bearing heat shield into ID of rear shaft. Align tabs of heat shield with slots in shaft ID and seat heat shield in rear shaft with the use of PWA 87179 Drift. Install the spiral retaining ring to the groove above the heat shield. See Figure 1004.

(4) Place diffuser airseal on work bench, smaller diameter up. Install the damper to the ID of the diffuser airseal. Find the unbalance symbol (triangle with unbalance value) on bolt hole flange. Locate bolt hole approximately 180 degrees opposite unbalance symbol and place ink mark on flange in line with that bolt hole.

(5) Set the diffuser airseal on Dry Ice P05−102 in the dry ice chest for a minimum of 25 minutes. Set the airseal so that the damper on the ID of the seal will not move.

(6) Attach PWA 87194 Handling Fixture to rear flange of rear drum. Lower the drum, front flange down, to PWA 87193 Hydraulic Pusher base detail and remove handling fixture. Locate the high point runout symbol (triangle within a circle). Locate bolt hole approximately 180 degrees opposite the high point runout symbol and place ink mark on slanted surface near tierod holes.

(7) Put PWA 87200 Heater on work table. Attach PWA 87194 Handling Fixture to front flange end of HPC rear shaft. Raise the shaft so that the nut and lift ring details of PWA 88712 Pusher can be installed on the threads at the smaller end of the shaft. Trunnion assembly, large diameter down and remove handling fixture. See Figure 1005.

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−01

CAUTION: SHAFT TEMPERATURE MUST NOT EXCEED 300°F (148.9°C).

(8) Lower shaft onto PWA 87200 Heater, resting shaft front flange onto plate inside heater ID. Heat shaft front flange to 275° − 300°F (135° − 149°C). See Figure 1006.

(9) Install retaining clips under rear flange of rear drum at all bolt holes, with radiused edge inside drum ID groove. Install tierods (head down) through clip and bolthole. Push tierods upward to snap into clip. Lightly lube tierod threads with Engine Oil P03−001 and remove the unwanted lubricant.

CAUTION: WHEN SHAFT ASSEMBLY IS LOWERED ONTO REAR DRUM, TAKE EXTREME CARE NOT TO PUSH TIERODS (INSTALLED IN REAR DRUM) OUT OF POSITION.

(10) After shaft front flange reaches 270° − 300°F (132° − 149°C), remove from heater and lower onto rear drum, aligning ink marks and tierods with tierod holes until mating flanges contact each other.

(11) Install the plate assembly detail of PWA 88712 Pusher into the rear hub shaft and locate the plate assembly against the HPC rear drum flange. Install PWA 12633 Hydraulic Ram and attach PWA 12632 Nut. See Figure 1007. Apply a hydraulic pressure of 3000 psi (20684.3 kPa) to the ram and keep this pressure until the shaft has cooled to approximately 70°F (21.1°C). Remove the press tooling.

(12) Locate shaft unbalance symbol (triangle with unbalance value), marked on upper flange OD of shaft. Ink mark face of tierod which is closest to the unbalance symbol.

(13) Remove airseal from freezer and install over shaft, large diameter down, aligning line on airseal with ink marked tierod. Use a nylon drift, tap airseal to seat.

NOTE: Exercise care not to push tierods out of position while installing airseal.

(14) Install four washers and nuts at approximately 90 degrees apart and, in an alternating pattern (first the nut at the 90 degree location, then 180, then 270, then 360), tighten nuts to seat. Next install additional nuts and washers at approximately 45, 135, 225 and 315 degree location. In an alternating pattern, tighten nuts to seat. Install remaining nuts and washers and tighten to seat.

(15) (Reference 1561) Install PWA 87379 Torque Fixture. Apply torques as follows, use an alternating sequence as marked on the index plate of torque fixture.

  (a) Apply initial torque of 240 - 260 lb-in. (27.116 - 29.376 N.m) to all 50 nuts.

  (b) Using same sequence, loosen nuts. Check prevailing (run-on) torque.

  NOTE: Prevailing torque must be a minimum of 9.5 lb-in. (1.073 N.m) or a maximum of 40 lb-in. (4.519 N.m). If prevailing torque limits are not met, replace nut.

  (c) Torque nuts to 20 - 30 lb-in. (2.260 - 3.390 N.m) plus the prevailing torque.

  (d) Apply 98 - 102 degrees angle of turn, while monitoring torque with torque wrench. Final torque value must not exceed 700 lb-in. (79.089 N.m). If final torque exceeds this maximum, replace nut and bolt.

D. Postrequisites

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−02

Task 72−35−39−440−002:

1. Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13)

A. Equipment And Materials Necessary − None

B. Procedure

(1) Assemble the 13th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 13th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−23, CONFIG−1 (Task 72−35−01−440−011).

C. Postrequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14). Refer to 72−35−39, Assembly−04, CONFIG−1 (Task 72−35−39−440−004).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-02

Task 72-35-39-440-010:

1. Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13)

A. General

(1) Use one of the procedures that follow to install the 13th stage blades.

(a) Use Task 2 (Task 72-35-39-440-010-A) of this procedure to install the 13th stage blades (drum rotor, PN 54H803-01 or 53H973-01, pre SB PW4ENG 72-565 or modified drum rotor, PN 54H803-001 or 53H973-001, post SB PW4ENG 72-565 only).

(b) Use Task 3 (Task 72-35-39-440-010-B) of this procedure to install the 13th stage blades (drum rotor, PN 56H013-01, post SB PW4ENG 72-565 only).

Task 72-35-39-440-010-A:

2. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 13) (Drum Rotor, PN 54H803-01 Or 53H973-01, Pre SB PW4ENG 72-565 Or Modified Drum Rotor, PN 54H803-001 Or 53H973-001, Post SB PW4ENG 72-565 Only)

A. Equipment And Materials Necessary - None

B. Procedure

(1) Assemble the 13th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 13th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Drum Rotor, PN 54H803-01 Or 53H973-01, Pre SB PW4ENG 72-565 Or Modified Drum Rotor, PN 54H803-001 Or 53H973-001, Post SB PW4ENG 72-565 Only) per 72-35-01, Assembly-23, CONFIG-2 (Task 72-35-01-440-021-A).

C. Postrequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14). Refer to 72-35-39, Assembly-04, CONFIG-2 (Task 72-35-39-440-011).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-02

Task 72-35-39-440-010-B:

3. Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13) (Drum Rotor, PN 56H013-01, Post SB PW4ENG 72-565 Only)

   A. Equipment And Materials Necessary - None

   B. Procedure

      (1) Assemble the 13th stage blades and attaching parts in the drum rotor.

         (a) Refer to Assemble The 13th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Drum Rotor, PN 56H013-01, Post SB PW4ENG 72-565 Only) per 72-35-01, Assembly-23, CONFIG-2 (Task 72-35-01-440-021-B).

   C. Postrequisites

      (1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14). Refer to 72-35-39, Assembly-04, CONFIG-2 (Task 72-35-39-440-011).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-03

Task 72-35-39-440-003:

1. Grind Stage 13 Through 15 HPC Blade Platforms

A. Equipment And Materials Required

Special Tools:
PWA 17019 Holder
PWA 85601 Fixture, Grinding (13th Stage)
PWA 85602 Fixture, Grinding (14th Stage)
PWA 85603 Fixture, Grinding (15th Stage)

B. Procedure

See Figure 1001.

(1) Install and secure PWA 85601 or PWA 85602 or PWA 85603 Fixture to surface plate of a surface grinding machine.

CAUTION: MAXIMUM MATERIAL REMOVAL PER PLATFORM SIDE MUST NOT EXCEED 0.005 INCH (0.127 mm).

(2) Install blade Type D or Type A, if applicable, into fixture and secure. Grind required amount of materials from blade platform. Each blade must have an equal amount of material removed. On any one blade, material removed must be in approximately equal amounts from both sides of platform.

(3) Remove blade from fixture and reinstall with ground platform down. Grind other platform to required amount removed from first grind. Remove blade from fixture. Blades with trimmed platforms must be identified with a square symbol in the time marking area. Use vibration peening as the marking method. See 70-11, Standard Practices Manual.

(4) Grind remaining blade platforms as required per previous instructions.

(5) Measure platform width using PWA 17019 Holder. If blade needs additional grinding repeat above steps. If blade is acceptable continue with procedure in Assembly-02 (Task 72-35-39-440-002) or Assembly-04 (Task 72-35-39-440-004) or Assembly-05 (Task 72-35-39-440-005).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−04

Task 72−35−39−440−004:

1. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13). Refer to 72−35−39, Assembly−02, CONFIG−1 (Task 72−35−39−440−002).

B. Equipment And Materials Required − None

C. Procedure

(1) Assemble the 14th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 14th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−22, CONFIG−1 (Task 72−35−01−440−010).

D. Postrequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 15). Refer to 72−35−39, Assembly−05, CONFIG−1 (Task 72−35−39−440−005).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-04

Task 72-35-39-440-011:

1. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 13). Refer to 72-35-39, Assembly-02 (Task 72-35-39-440-010).

B. Equipment And Materials Required - None

C. General

(1) Use one of the procedures that follow to install the 14th stage blades.

(a) Use Task 2. (Task 72-35-39-440-011-A) of this procedure to install the 14th stage blades in pre SB PW4ENG 72-565 HPC assemblies.

(b) Use Task 3. (Task 72-35-39-440-011-B) of this procedure to install the 14th stage blades in post SB PW4ENG 72-565 HPC assemblies.

Task 72-35-39-440-011-A:

2. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14), (Pre SB PW4ENG 72-565 Only)

A. Procedure

(1) Assemble the 14th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 14th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72-35-01, Assembly-22, CONFIG-2 (Task 72-35-01-440-020-A).

B. Postrequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 15). Refer to 72-35-39, Assembly-05, CONFIG-2 (Task 72-35-39-440-012).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−04

Task 72−35−39−440−011−B:

3. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 14), (Post SB PW4ENG 72−565 Only)

A. Procedure

(1) Assemble the 14th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 14th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Post SB PW4ENG 72−565 Only) per 72−35−01, Assembly−22, CONFIG−2 (Task 72−35−01−440−020−B).

B. Postrequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 15). Refer to 72−35−39, Assembly−05, CONFIG−2 (Task 72−35−39−440−012).

Previous Pageblock Return to Previous Menu Next Pageblock

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−05

Task 72−35−39−440−005:

1. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14). Refer to 72−35−39, Assembly−04, CONFIG−1 (Task 72−35−39−440−004).

B. Equipment And Materials Required

Special Tools:

PWA 80763	Inserter, Tierod

C. Procedure

(1) Assemble the 15th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 15th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly per 72−35−01, Assembly−21, CONFIG−1 (Task 72−35−01−440−008).

(2) Install tierods to tierod holes of drum rotor. Using PWA 80763 Inserter secure tierods to drum flange. See Figure 1001.

D. Postrequisites

(1) Assemble The (Bladed) Axial Compressor Rotor Assembly. Refer to 72−35−01, Assembly−01 (Task 72−35−01−440−001).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY − ASSEMBLY−05

(Task 72−35−39−440−005)

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-05

Task 72-35-39-440-012:

1. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15)

A. General

(1) Use one of the three procedures that follow to install the 15th stage blades.

(a) Use Task 2. (Task 72-35-39-440-012-A) of this procedure to install the 15th stage blades (drum rotor, PN 54H803-01 or 53H973-01, pre SB PW4ENG 72-565 only).

(b) Use Task 3. (Task 72-35-39-440-012-B) of this procedure to install the 15th stage blades (modified drum rotor, PN 54H803-001 or 53H973-001, post SB PW4ENG 72-565 only).

(c) Use Task 4. (Task 72-35-39-440-012-C) of this procedure to install the 15th stage blades (new drum rotor, PN 56H013-01, post SB PW4ENG 72-565 only).

Task 72-35-39-440-012-A:

2. Assemble drum Rotor And Blades (Rear) Assembly (Stage 15) (Drum Rotor, PN 54H803-01 Or 53H973-01, Pre SB PW4ENG 72-565 Only)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14). Refer to 72-35-39, Assembly-04, CONFIG-2 (Task 72-35-39-440-011).

B. Equipment And Materials Necessary

Special Tools:

PWA 80763	Inserter, Tierod

C. Procedure

(1) Assemble the 15th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 15Th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Drum Rotor, PN 54H803-01 Or 53H973-01, Pre SB PW4ENG 72-565 Only) per 72-35-01, Assembly-21, CONFIG-2 (Task 72-35-01-440-009-A).

(2) Install the tierods to the tierod holes of the drum rotor. Use PWA 80763 Inserter to secure the tierods to the drum flange. See Figure 1001.

D. Postrequisites

(1) Assemble The (Bladed) Axial Compressor Rotor Assembly. Refer to 72-35-01, Assembly-01 (Task 72-35-01-440-001).

Task 72-35-39-440-012-B:

3. Assemble Drum Rotor And Blades (Rear) Assembly (Stage 15) (Modified Drum Rotor, PN 54H803-001 Or 53H973-001, Post SB PW4ENG 72-565 Only)

A. Prerequisites

(1) Assemble The Drum Rotor And Blades (Rear) Assembly (Stage 14) (Post SB PW4ENG 72-565 Only). Refer to 72-35-39, Assembly-04, CONFIG-2 (Task 72-35-39-440-011).

B. Equipment And Materials Required

Special Tools:

PWA 80763	Inserter, Tierod

C. Procedure

(1) Assemble the 15th stage blades and attaching parts in the drum rotor.

(a) Refer to Assemble The 15th Stage Blades In The (Debladed) Axial Compressor Rotor Assembly (Modified Drum Rotor, PN 54H803-001 Or 53H973-001, Post SB PW4ENG 72-565 Only) per 72-35-01, Assembly-21, CONFIG-2 (Task 72-35-01-440-009-B).

(2) Install the tierods to the tierod holes of the drum rotor. Use PWA 80763 Inserter to secure the tierods to the drum flange. See Figure 1001.

D. Postrequisites

(1) Assemble The (Bladed) Axial Compressor Rotor Assembly. Refer to 72-35-01, Assembly-01 (Task 72-35-01-440-001).

DRUM ROTOR AND BLADES (REAR) ASSEMBLY - ASSEMBLY-09

Task 72-35-39-440-009:

1. Assemble Drum Rotor And Blades (Rear) Assembly (Stages 13, 14 And 15) With Limited Number Of Replacement Blades Of Pre-Ground Zirconium Oxide Tips (Post SB PW4ENG 72-599)

A. Prerequisites

(1) Assemble drum rotor and blades (rear) assembly (Stage 13) per Assembly-02 (Task 72-35-39-440-002).

(2) Assemble drum rotor and blades (rear) assembly (Stage 14) per Assembly-04 (Task 72-35-39-440-004).

(3) Assemble drum rotor and blades (rear) assembly (Stage 15) per Assembly-05 (Task 72-35-39-440-005).

B. Equipment And Materials Required

Special Tools:
PWA 86448 Drift

Consumable Materials:

Item No.	Designation
P06-009	Antiseize Compound (PMC 9523)

C. Procedure

(1) This procedure provides for the replacement of a limited number of blades in HPC Stages 13, 14 and 15 with pre-ground zirconium oxide tip blades per SB PW4ENG 72-599 which do not require additional rotor grind to meet the engine manual rotor diameter. These blades can be used for individual blade replacement in a rotor that has previously been rotor ground.

NOTE: There are three part numbers (sets) of blades provided for each stage. Set Type A contains the majority of blades to be installed around the drum. Set Type B has notches in the right edge of blade platforms. Set Type C has notches in the left edge of blade platforms. When Types B and C blades are placed together, clearance is formed for a blade lock. Set Type A is also used for fitting and may require platform grinding. For ease of assembly, blades in the referenced assembly procedures will be referred to as Types A, B and C.

CAUTION: WHEN YOU NEED TO MOVE AND SET THE BLADES IN ONE OF THE REFERENCED ASSEMBLY PROCEDURES, USE THE PWA 86448 DRIFT. THE USE OF A DIFFERENT METHOD TO MOVE AND SET THE BLADES CAN CAUSE AIRFOIL DAMAGE.

(2) Replacement HPC blades with thin pre−ground zirconium coated tips can be used in any or all rotor Stages 13 through 15, up to a seven blade per stage limit in any combination of Type A, B or C blades.

(3) The thin zirconium tip blades can replace either ground aluminum oxide or zirconium tip blades.

(4) No more than three new pre−ground thin zirconium tip replacement blades can be installed adjacent to each other.

(5) FOR THESE MODELS: 4152, 4156A, 4158
HPC blades, Stages 13 through 15, which have root chamfers may be mixed with those that do not have root chamfers as long as they are equally spaced around the rotor at assembly to minimize rotor unbalance.

D. Postrequisites

(1) Assemble axial compressor rotor assembly 72−35−01, Assembly−01 (Task 72−35−01−440−001).

STAGE 11 AND 12 COMPRESSOR STATOR SET - ASSEMBLY-01

Task 72-35-61-440-001:

1. Assemble Stages 11 And 12 Compressor Stator Set, Shroud Sets, And Springs

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P06-058	Lubricant, Fatty Alcohol-Type (PMC 9264)

Special Tools:

PWA 86507	Fixture, Assembly

B. Procedure

See Figure 1001, Figure 1002 and Figure 1003.

(1) Assemble the 12th stage HPC compressor stator shroud set and four springs as follows.

NOTE: Make sure that the four stator segments have the same serial number. Make sure that the 12 shroud segments have the same serial number. See Figure 1001.

(a) Position the stator segment with mating No. 1 and 2 in PWA 86705 Fixture, front end down, in the groove on the fixture base and locate angularly against the fixture stop. Position the clamp cover assembly over the stator set and tighten it into place. Engage the two (2) quick release clamps. See Figure 1003.

(b) Arrange shroud sets on bench in four sets of three. See Table 1001.

	SET 1	SET 2	SET 3	SET 4
PART NUMBER	52H992-05	52H992-05	52H992-05	52H992-05

SECTION	B - C	E - F	H - I	K - L
PART NUMBER	52H992-07	52H992-07	52H992-07	52H992-07
SECTION	C - D	F - G	I - J	L - A

Arrange The Shroud Sets - Stage 12
Table 1001

STAGE 11 AND 12 COMPRESSOR STATOR SET − ASSEMBLY−01

SET 1	SET 2	SET 3	SET 4

NOTE: If an individual shroud segment is damaged, and that segment is not serviceable, that segment together with the two adjacent shroud segments that are contained within a stator segment, can be replaced with three adjacent segments from another segment set. With this procedure, each damper spring will interface with three matched shroud segments. Surplus details can be retained for similar replacement requirements.

Arrange The Shroud Sets − Stage 12
Table 1001 (Continued)

(c) Install the 12th stage insert into the insert holder, top slot, and tighten the knurled screws.

(d) Apply Fatty Alcohol−Type Lubricant P06−058 to the spring and shroud set surfaces as necessary to help in the assembly process. See Figure 1002.

(e) Place a Spring, PN52H876, in ID slot of 12th stage stator segment, with slotted end of the spring contacting the stop pin of the stator. Hold the end of the spring in place with the torque clamp.

(f) As indicated in Table 1001, insert shroud, C−D from Set 1, into the ID slot of the 12th stage over the spring, engaging legs of shroud in slot in vanes, with the arrow on rear of shroud pointing down. See Figure 1001.

(g) Apply pressure with the pivot arm assembly until the shroud segment end engages pin in slot. See Figure 1003.

(h) Make sure that the spring is engaged against the pin and that the recessed end of the shroud is engaged over the pin.

(i) Insert shroud, B−C from Set 1, into the ID slot of the 12th stage using previous instructions with the arrow on rear of shroud pointing down.

(j) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of segment using 0.025 inch (0.635 mm) feeler stock.

(k) Insert shroud, A−B from Set 1, into the ID slot of the 12th stage using previous instructions with the arrow on rear of shroud pointing down.

(l) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of segment using 0.025 inch (0.635 mm) feeler stock.

(m) Make sure that the flat end of the shroud does not overhang the end of the stator assembly and angular ends of shrouds are approximately equally spaced.

(n) Repeat the above procedure for the three remaining 12th stage stator assemblies installing the shrouds in Set 2 in stator assembly 2 − 3, Set 3 in stator assembly 3 − 4 and Set 4 in stator assembly 4 − 1. See Table 1001.

(2) Assemble the 11th stage HPC compressor stator shroud set and four springs as follows.

NOTE: Make sure that the 12 shroud segments have the same serial number. See Figure 1001.

(a) Arrange shrouds on the bench in four sets of three. See Table 1002.

	SET 1	SET 2	SET 3	SET 4
PART NUMBER	53H391−5	53H391−5	53H391−5	53H391−5

SECTION	B − C	E − F	H − I	K − L
PART NUMBER	53H391−7	53H391−7	53H391−7	53H391−7
SECTION	C − D	F − G	I − J	L − A

Arrange The Shroud Sets − Stage 11
Table 1002

STAGE 11 AND 12 COMPRESSOR STATOR SET − ASSEMBLY−01

SET 1	SET 2	SET 3	SET 4

NOTE: If an individual shroud segment is damaged, and that segment is not serviceable, that segment together with the two adjacent shroud segments that are contained within a stator segment, can be replaced with three adjacent segments from another segment set. With this procedure, each damper spring will interface with three matched shroud segments. Surplus details can be retained for similar replacement requirements.

Arrange The Shroud Sets − Stage 11
Table 1002 (Continued)

(b) Position the stator segment with mating No. 1 and 2 in PWA 86507 Fixture, front end down, in the groove on the fixture base and locate angularly against the fixture stop. Position the clamp cover assembly over the stator set and tighten it into place. Engage the two (2) quick release clamps. See Figure 1003.

(c) Install the 11th stage insert into the insert holder, bottom slot, and tighten knurled screws.

(d) Apply Fatty Alcohol−Type Lubricant P06−058 to the spring and shroud set surfaces as necessary to help in the assembly process. See Figure 1002.

(e) Place a Spring, PN52H875, in ID slot of 11th stage stator segment, with slotted end of the spring contacting the stop pin of the stator. Hold the end of the spring in place with the torque clamp.

(f) As indicated in Table 1002, insert shroud, C−D from Set 1, into the ID slot of the 11th stage over spring, engaging legs of shroud in slot in vanes, with the arrow on rear of shroud pointing down. See Figure 1001.

(g) Apply pressure with the pivot arm assembly until the shroud segment end engages pin in slot. See Figure 1003.

(h) Make sure that the spring is engaged against the pin and that the recessed end of the shroud is engaged over the pin.

(i) Insert shroud, B−C from Set 1, into the ID slot of the 11th stage using previous instructions with the arrow on rear of shroud pointing down.

(j) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of the segment using 0.025 inch (0.635 mm) feeler stock.

(k) Insert shroud, A−B from Set 1, into the ID slot of the 11th stage using previous instructions with the arrow on rear of shroud pointing down.

(l) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of the segment using 0.025 inch (0.635 mm) feeler stock.

(m) Make sure that the flat end of the shroud does not overhang the end of the stator assembly and angular ends of shrouds are approximately equally spaced.

(n) Repeat the above procedure for the three remaining 11th stage stator assemblies installing the shrouds in Set 2 in stator assembly 2 − 3, Set 3 in stator assembly 3 − 4 and Set 4 in stator assembly 4 − 1. See Table 1002.

(3) Visually check completed assembly for correct assembly, security of details, absence of damage and absence of foreign material. Particular attention should be directed to mating surfaces.

STAGE 13 AND 14 COMPRESSOR STATOR SET - ASSEMBLY-01

Task 72-35-62-440-001:

1. Assemble Stages 13 And 14 Compressor Stator Set, Shroud Sets, And Springs

A. Equipment And Materials Necessary

Consumable Materials:

Item No.	Designation
P06-058	Lubricant, Fatty Alcohol-Type (PMC 9264)

Special Tools:

PWA 87856	Fixture, Assembly

B. Procedure
See Figure 1001, Figure 1002 and Figure 1003.

(1) Assemble the 14th stage HPC compressor stator shroud set and four springs as follows.

NOTE: Make sure that the four stator segments have the same serial number. Make sure that the 12 shroud segments have the same serial number. See Figure 1001.

(a) Position the stator segment with mating No. 1 and 2 in PWA 87856 Fixture, front end down, in the groove on the fixture base and locate angularity against the fixture stop. Position the clamp cover assembly over the stator set and tighten it into place. Engage the two (2) quick release clamps. See Figure 1003.

(b) Arrange shroud sets on bench in four sets of three. See Table 1001.

	SET 1	SET 2	SET 3	SET 4
PART NUMBER	52H893-05	52H893-05	52H893-05	52H893-05
SECTION	A - B	D - E	G - H	J - K
PART NUMBER	52H893-06	52H893-06	52H893-06	52H893-06
SECTION	B - C	E - F	H - I	K - L
PART NUMBER	52H893-07	52H893-07	52H893-07	52H893-07
SECTION	C - D	F - G	I - J	L - A

Arrange The Shroud Sets
Table 1001

STAGE 13 AND 14 COMPRESSOR STATOR SET − ASSEMBLY−01

SET 1	SET 2	SET 3	SET 4

NOTE: If an individual shroud segment is damaged, and that segment is not serviceable, that segment together with the two adjacent shroud segments that are contained within a stator segment, can be replaced with three adjacent segments from another segment set. With this procedure, each damper spring will interface with three matched shroud segments. Surplus details can be retained for similar replacement requirements.

Arrange The Shroud Sets
Table 1001 (Continued)

(c) Install the 14th stage insert into the insert holder, top slot, and tighten the knurled screws.

(d) Apply Fatty Alcohol−Type Lubricant P06−058 to all the spring and shroud set surfaces as necessary to help in the assembly process. See Figure 1002 for applicable areas.

(e) Place a Spring, PN52H878, in ID slot of 14th stage stator segment, with slotted end of the spring contacting the stop pin of the stator. Hold the end of the spring in place with the torque clamp.

(f) As indicated in Table 1001, insert shroud, C−D from Set 1, into the ID slot of the 14th stage over the spring, engaging legs of shroud in slot in vanes, with the arrow on rear of shroud pointing down. See Figure 1001.

(g) Apply pressure with the pivot arm assembly until the shroud segment end engages pin in slot. See Figure 1003.

(h) Make sure that the spring is engaged against the pin and that the recessed end of the shroud is engaged over the pin.

(i) Insert shroud, B−C from Set 1, into the ID slot of the 14th stage using previous instructions with the arrow on rear of shroud pointing down.

(j) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of segment using 0.025 inch (0.635 mm) feeler stock.

(k) Insert shroud, A−B from Set 1, into the ID slot of the 14th stage using previous instructions with the arrow on rear of shroud pointing down.

(l) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of segment using 0.025 inch (0.635 mm) feeler stock.

(m) Make sure that the flat end of the shroud does not overhang the end of the stator assembly and angular ends of shrouds are approximately equally spaced.

(n) Repeat the above procedure for the three remaining 14th stage stator assemblies installing the shrouds in Set 2 in stator assembly 2 − 3, Set 3 in stator assembly 3 − 4 and Set 4 in stator assembly 4 − 1. See Table 1001.

(2) Assemble the 13th stage HPC compressor stator shroud set and four springs as follows.

NOTE: Make sure that the 12 shroud segments have the same serial number. See Figure 1001.

(a) Arrange shrouds on the bench in four sets of three. See Table 1001.

(b) Position the stator segment with mating No. 1 and 2 inPWA 87856 Fixture, front end down, in the groove on the fixture base and locate angularity against the fixture stop. Position the clamp cover assembly over the stator set and tighten it into place. Engage the two (2) quick release clamps. See Figure 1003.

(c) Install the 13th stage insert into the insert holder, bottom slot, and tighten knurled screws.

(d) Apply Fatty Alcohol−Type Lubricant P06−058 to all the spring and shroud set surfaces as necessary to help in the assembly process. See Figure 1002 for applicable areas.

(e) Place a Spring, PN52H877, in ID slot of 13th stage stator segment, with slotted end of the spring contacting the stop pin of the stator. Hold the end of the spring in place with the torque clamp.

(f) As indicated in Table 1001, insert shroud, C−D from Set 1, into the ID slot of the 13th stage over spring, engaging legs of shroud in slot in vanes, with the arrow on rear of shroud pointing down. See Figure 1001.

(g) Apply pressure with the pivot arm assembly until the shroud segment end engages pin in slot. See Figure 1003.

(h) Make sure that the spring is engaged against the pin and that the recessed end of the shroud is engaged over the pin.

(i) Insert shroud, B−C from Set 1, into the ID slot of the 13th stage using previous instructions with the arrow on rear of shroud pointing down.

(j) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end of previously installed shroud. Check position of the segment using 0.025 inch (0.635 mm) feeler stock.

(k) Insert shroud, A−B from Set 1, into the ID slot of the 11th stage using previous instructions with the arrow on rear of shroud pointing down.

(l) Using the pivot arm assembly, position shroud segment until angled end of shroud is approximately 0.025 inch (0.635 mm) from mating angled end o previously installed shroud. Check position of the segment using 0.025 inch (0.635 mm) feeler stock.

(m) Make sure that the flat end of the shroud does not overhang the end of the stator assembly and angular ends of shrouds are approximately equally spaced.

(n) Repeat the above procedure for the three remaining 13th stage stator assemblies installing the shrouds in Set 2 in stator assembly 2 − 3, Set 3 in stator assembly 3 − 4 and Set 4 in stator assembly 4 − 1. See Table 1001.

(3) Visually check completed assembly for correct assembly, security of details, absence of damage and absence of foreign material. Particular attention should be directed to mating surfaces.

DIFFUSER AND COMBUSTOR - HOW TO USE MANUAL

Task 72-41-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Diffuser And Combustor parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

DIFFUSER AND COMBUSTOR - DESCRIPTION/OPERATION-00

Task 72-41-00-990-002:

1. General

See Figure 1 and Figure 2.

A. Description

(1) The compressed air flows from the exit of the high pressure compressor into the diffuser and combustor section. The airflow is straightened and diffused (allowed to expand) which reduces the velocity and raises the pressure of the airflow prior to entering the combustion chamber. Metered fuel is provided to the combustion chamber through fuel injectors. The fuel and air mixture is burned within the combustion chamber. The heat of the combustion process causes the airflow to expand and accelerate rearward to drive the turbines and produce thrust at the exhaust (jet) nozzle.

(2) The diffuser and combustor section consists of; a cast nickel alloy case, a cast compressor exit (Stage 15) stator assembly, twenty four fuel injector (nozzle) and support assemblies, two igniter plugs, the No. 3 bearing compartment, and the outer combustion chamber (liner) assembly.

B. Operation

(1) Diffuser Case Assembly

(a) The diffuser case is a main structural element for the engine, supporting the No. 3 bearing and rear of the high pressure rotor system. The case is a housing for all of the detail parts of the diffuser and combustor section. The outer wall of the case forms the outer contour of the diffused (expanded) gaspath. This outer wall also contains mounting provisions for the externally removable fuel injectors and the two igniter plugs.

(b) Eight removable plugs in the outer wall of the case provide access for borescope inspection of the compressor exit stator vanes, combustion chamber liners, fuel injectors, stage 1 HPT vane cluster assemblies, and stage 1 HPT blades. Four mounting bosses are provided for connecting to the aircraft pneumatic (service bleed) system.

(c) The inner structure of the case is supported by twenty four integrally cast hollow struts at the forward end. This structure consists of the wall which forms the inner contour of the diffused gaspath and the attachment flange for the No. 3 bearing housing. The structure provides radial load carrying support for the bearing compartment through the struts.

(d) The hollow struts provide radial passages across the gaspath for oil supply, breather, and scavenge tubes and for tubes suppling cooling air to the No. 3 bearing compartment and the high pressure turbine.

(2) Compressor Exit Stator Assembly

(a) The compressor exit stator assembly is bolted to a flange in the diffuser case forward of the struts and divergent diffuser airflow nozzle. The stator is an integrally cast vane, shroud, and transition duct assembly.

(b) The vanes straighten the rotational motion of the airflow from the compressor (Stage 15) rotor and direct the airflow axially rearward. The inner and outer shrouds form a transition duct for high pressure compressor discharge gaspath into the diffuser airflow nozzle.

(3) Combustion Chamber (Liner) Assemblies

(a) The combustion chamber assemblies are fabricated in two sections. The inner combustion chamber (liner) assembly is a part of the turbine nozzle section (See 72−51−00, Description And Operation) for assembly purposes. The outer combustion chamber (liner) assembly is a part of this diffuser and combustor section. The two combustor chamber assemblies form a short double pass flow type burner utilizing a welded rolled ring construction for the liner sections and a cast forward bulkhead. The inner surfaces which are exposed to combustion gasses are coated with a magnesium zirconate material as a thermal barrier protection.

(b) The outer chamber is retained to the outer wall of the diffuser case at the forward end by twelve doweled end bolts. The rear of the chamber is positioned and retained to the turbine nozzle by a guide and circumferential clamp assembly. The guide and clamp assembly is adjusted during assembly to provide a slip−fit sealing feature with the outer diameter of the combustion chamber.

(c) The combustion chamber provides mixing of the fuel from the fuel injectors with the proper amount of air for optimum combustion. Combustion of the fuel is contained within the forward and middle section of the chamber, rearward of the fuel injector nozzles. The rear portion of the chamber allows for complete mixing of the remaining airflow with the hot combustion gases and for the transition to the turbine nozzle.

(4) No. 3 Bearing And Compartment

(a) The No. 3 bearing is a roller type bearing with a one piece inner and one piece outer race. The individual rollers are positioned to the inner race by a retainer device.

(b) The No. 3 bearing compartment consists of the front (spring loaded) carbon seal assembly, the bearing housing, and the rear (spring loaded) carbon seal assembly. The bearing housing is attached to the inner rear flange of the diffuser case. The front and rear carbon seal assemblies are bolted to the bearing housing.

(c) The carbon seal assemblies form the compartment oil sump. The nozzle which supplies oil to the bearing and seals is attached to the front seal assembly.

(d) The bearing compartment is provided with a heat shield duct which is supplied with precooled stage 12 high compressor air.

DIFFUSER AND COMBUSTOR - REMOVAL-01

Task 72-41-00-030-004:

1. Remove The No. 3 Roller Bearing Outer Race - Diffuser And Combustor

A. Equipment And Materials Required

Special Tools:

PWA 25039	Stand
PWA 28657	Sling
PWA 76154	Adapter (Two Necessary)
PWA 80178	Multiplier, Torque
PWA 85044	Stand, Build (Optional To PWA 86508)
PWA 85168	Protector
PWA 85751	Bracket (Two Necessary)
PWA 86489	Puller
PWA 86491	Driver, Torque
PWA 86508	Stand, Build
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

B. Procedure

Subtask 72-41-00-030-072:

(1) Install the case in a stand as follows. See Figure 301 and Figure 302.

(a) Install two PWA 85751 Handling Brackets on the diffuser case as follows.

1 With a hoist, lift a bracket. Install the detail pins of the bracket in boltholes in the front flange of the diffuser case at 3 or 9 o'clock. Attach the rear flange of the bracket to the rear flange of the diffuser case with the detail nuts and bolts.

2 Attach the spool to the bracket in the "MODULE" holes.

3 Install the other bracket at 3 or 9 o'clock, as applicable.

WARNING: TWO OPERATORS ARE NECESSARY WHEN YOU TRUNNION THE CASE IN THE STAND. WHEN YOU REMOVE THE BALL LOCK PIN, IT IS POSSIBLE

FOR THE CASE TO TRUNNION BY ITSELF AND CAUSE INJURY.

(b) With a hoist, PWA 28657 Sling, and two PWA 76154 Adapters at the outer spools of PWA 85751 Brackets, install the diffuser and combustor in PWA 25039 Stand, PWA 85044 Stand or PWA 86508 Stand.

Subtask 72−41−00−030−073:

(2) Remove the No. 3 bearing (outer race) retaining nut as follows. See Figure 303.

(a) Install six workbolts, lubricated with Engine Oil P03−001, in the boltholes in the OD flange of the bearing housing. Install them at equal distances from each other. Torque the workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts must be quality standard bolts that are .375−24 X 1.00 inch (25.400 mm).

(b) Install PWA 85168 Protector in the diffuser and combustor. Install the small end first.

(c) Remove and discard the rivet from the nut.

(d) Install PWA 86491 Driver on the No. 3 bearing housing, with the teeth of the tool in the slots of the nut. Attach the driver to the housing with the detail cap screws.

(e) Mechanical Wrench Method (Optional) − See Figure 303, Sheet 2.

1 Install PWA 102743 Torque Adapter (303/3) to engage the slots in the retaining nut.

2 Install PWA 102744 Holder Adapter (303/4) over PWA 102743 Torque Adapter (303/3) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

3 Install PWA 80187 Torque Multiplier (303/5) to engage both PWA 102743 Torque Adapter (303/3) and PWA 102744 Holder Adapter (303/4).

(f) Loosen the bearing retaining nut. Remove the nut.

Subtask 72−41−00−030−074:

(3) Remove the No. 3 roller bearing outer race. Use PWA 86489 Puller as follows.

(a) Turn the large hex head cap screw clockwise for the full length of the screw.

(b) Turn the three hand knobs counterclockwise for the full length of the stems of the knobs.

(c) Install the puller in the bearing housing. The jaws must align with the scallops in the housing.

(d) Carefully and equally, turn the hand knobs clockwise until the jaws fully engage the scallops of the bearing housing.

(e) Turn the large hex head cap screw counterclockwise until the outer race is free.

CAUTION: YOU MUST WEAR CLEAN, LINT FREE GLOVES WHEN YOU TOUCH BEARINGS. IF NOT YOU WILL CAUSE DAMAGE TO THE BEARINGS.

CAUTION: YOU MUST KEEP THE BEARING OUTER RACE WITH THE MATING BEARING INNER RACE AND ROLLERS IN A CONTAINER.

(f) Remove the bearing outer race.

(4) Remove the protector and the workbolts. Install the protector.

DIFFUSER AND COMBUSTOR - INSTALLATION-01

Task 72-41-00-430-001:

1. Install The No. 3 Roller Bearing Outer Race - Diffuser And Combustor

A. Prerequisites

(1) See 72-41-00, Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials

Special Tools:

PWA 25039	Stand
PWA 28657	Sling
PWA 29754	Control, Heater
PWA 76154	Adapter (Two Necessary)
PWA 80187	Multiplier, Torque
PWA 85044	Stand (Optional to PWA 86508)
PWA 85168	Protector
PWA 85679	Heater (Optional To PWA 85795)
PWA 85751	Bracket (Two Necessary)
PWA 85795	Heater
PWA 85901	Riveter, Hand
PWA 86491	Driver, Torque
PWA 86508	Build Stand
PWA 87433	Drift
PWA 102743	Adapter, Torque
PWA 102744	Adapter, Holder

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-026	Ink, Marking (PMC 4057-1)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Rivet	1	72-41-00/12/40

C. Procedure

DIFFUSER AND COMBUSTOR − INSTALLATION−01

(1) Install the case in a stand as follows. See Figure 401 and Figure 402.

(a) Install two PWA 85751 Handling Brackets on the diffuser case as follows.

1 With a hoist, lift a bracket. Install the four pins in the front flange of the bracket in holes in the front flange of the diffuser case at 3 or 9 o'clock. Attach the rear flange of the bracket to the rear flange of the diffuser case with the detail nuts and bolts.

2 Put the double spool bracket in the "MODULE" holes.

3 Install the other handling bracket at 3 or 9 o'clock, as applicable.

WARNING: TWO OPERATORS ARE NECESSARY WHEN YOU TRUNNION THE CASE IN THE STAND. WHEN YOU REMOVE THE BALL LOCK PIN, IT IS POSSIBLE FOR THE CASE TO TRUNNION BY ITSELF AND CAUSE INJURY.

(b) With a hoist, PWA 28657 Sling, and two PWA 76154 Adapters at the outer spools of PWA 85751 Brackets, install the diffuser and combustor in PWA 25039 Stand, PWA 86508 Stand or PWA 85044 Stand.

CAUTION: THE BEARING OUTER RACE AND THE BEARING INNER RACE AND ROLLERS MUST BE DETAILS OF THE SAME BEARING ASSEMBLY. BE SURE THAT THE OUTER RACE YOU INSTALL NOW AND THE INNER RACE AND ROLLERS THAT YOU WILL INSTALL IN LATER PROCEDURE ARE DETAILS OF THE SAME BEARING ASSEMBLY.

CAUTION: TO PREVENT BEARING DAMAGE, YOU MUST WEAR CLEAN, LINT−FREE GLOVES WHEN YOU TOUCH THE OUTER RACE.

(2) (Dimension D) Measure the thickness of the No. 3 bearing outer race (called outer race). Write this dimension. See Figure 403.

(3) (Dimension E) Measure the distance from the top of the No. 3 bearing housing (called bearing housing) to the shoulder of the housing. Write this dimension.

(4) Find two dimples on the top surface of the threaded ID of the bearing housing. With Marking Ink P05−026, make a mark between the dimples.

(5) Heat the bearing housing as follows.

NOTE: If you use PWA 85679 Heater, you must make and use a heat shield that protects the inner race and rollers.

(a) Install either PWA 85795 Heater or PWA 85679 Heater on the rear flange of the bearing housing. Connect the power and thermocouple cables to PWA 29754 Control.

(b) Set the heater to 300°F (149°C). Heat the housing for 55 − 60 minutes. When the No. 3 bearing housing is at 300°F (148.9°C), turn off the heater. Disconnect the control and remove the heater from the housing.

CAUTION: YOU MUST WEAR CLEAN GLOVES WHEN YOU TOUCH THE OUTER RACE. IF NOT, YOU WILL CAUSE DAMAGE TO TO THE BEARING.

(6) (Reference 1006) Install the outer race, part number up, in the bearing housing. Align the "X" mark on the outer race with the ink mark between the two dimples on the top of the housing.

CAUTION: DO NOT HIT THE BEARING ROLLERS WITH THE DRIFT WHEN YOU INSTALL THE OUTER RACE.

(7) Install PWA 87433 Drift on the outer race and over the bearing housing. Hit the drift lightly with a mallet. Make sure the outer race touches the shoulder of the bearing housing. Remove the drift.

DIFFUSER AND COMBUSTOR − INSTALLATION−01

CAUTION: TO PREVENT AN INCORRECT BEARING OUTER RACE DIMENSIONAL CHECK, THE NO. 3 BEARING HOUSING MUST BE AT ROOM TEMPERATURE. IT IS PERMITTED TO USE SHOP AIR TO COOL THE ASSEMBLY. DO NOT USE DRY ICE.

(8) When the No. 3 roller bearing is at room temperature, do a dimensional check of the location of the outer race.

(a) (Distance F) Measure from the top of the bearing housing to the top of the outer race. Dimension F >= Dimension E − Dimension D

(b) If the equation is not true, the outer race is not correctly installed.

(9) Install six workbolts, lubricated with Engine Oil P03−001, into boltholes in the OD flange of the bearing housing. Install them at equal distances from each other. Torque the workbolts to 290 − 325 lb−in. (32.766 − 36.720 N.m).

NOTE: The workbolts must be quality standard bolts that are .375−24 X 1.00 inch (25.400 mm).

(10) Install PWA 85168 Protector in the diffuser case.

CAUTION: IF THE NUT YOU INSTALL IS NOT NEW, YOU MUST PUT NEW SILVER PLATE ON IT BEFORE YOU INSTALL IT. IF YOU DO NOT, IT WILL CAUSE DAMAGE TO MATING PARTS. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(11) Install the No. 3 bearing (outer race) retaining nut (called nut) as follows.

(a) Lubricate the No. 3 bearing (outer race) retaining nut (called nut) with Engine Oil P03−001.

(b) Install the nut, slots up, in the bearing housing. Tighten the nut with your hand.

(c) Install PWA 86491 Driver on the bearing housing, with the teeth of the tool in the slots of the nut. Attach the driver to the bearing housing with the detail cap screws.

(d) Mechanical Wrench Method (Optional) − See Figure 403, Sheet 2.

1 Install PWA 102743 Torque Adapter (403/4) to engage the slots in the retaining nut.

2 Install PWA 102744 Holder Adapter (403/4) and attach it to the bearing housing with the four detail bolts. Tighten the bolts.

3 Install PWA 80187 Torque Multiplier (403/6) to engage both PWA 102743 Torque Adapter (403/5) and PWA 102744 Holder Adapter (403/5).

CAUTION: IF, TO INSTALL THIS NUT, YOU MUST TORQUE THE NUT MORE THAN THREE TIMES, YOU MUST REMOVE THE NUT AND PLATE IT AGAIN BEFORE YOU TORQUE IT THE FOURTH TIME. THE MAXIMUM NUMBER OF TIMES YOU CAN TORQUE THE NUT BEFORE IT IS NECESSARY TO REPLATE IT IS THREE. TO PLATE THE NUT, REFER TO PW4000 SERIES CIR, PN 51A357.

(e) (Reference 975) Torque the nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m).

NOTE: Use a torque wrench with the driver.

(f) (Reference 975) Turn the nut through an angle of 16° − 17° 30'.

NOTE: Use a mallet with the driver.

(g) (Reference 975) Loosen the nut to 0 lb−in. (0 N.m).

(h) (Reference 975) Torque the nut to 3600 − 4400 lb−in. (406.745 − 497.133 N.m).

NOTE: Use a torque wrench with the driver.

(i) (Reference 975) Turn the nut through an angle of 16° − 17° 30'. At the same time, align the rivet hole in the nut with the rivet hole in the bearing housing.

(j) Remove the driver. Remove the workbolts.

(k) Install a rivet in the nut. Use PWA 85901 Riveter to flare the rivet.

DIFFUSER AND COMBUSTOR - DISASSEMBLY-01

Task 72-41-00-030-001:

1. Remove Fuel Distribution Valve And Fuel Supply Tubes

A. Equipment And Materials Necessary

Standard Tools:

Jackscrews 0.190-32 (Two Necessary)

Special Tools:

PWA 28657	Sling
PWA 76154	Adapter
PWA 85044	Build Stand (Optional to PWA 86508)
PWA 85751	Bracket (2 Necessary)
PWA 86508	Build Stand
PWA 104096	Puller

B. Procedure

Subtask 72-41-00-030-069:

(1) Install PWA 85751 Brackets to diffuser case. With PWA 76154 Adapter on PWA 28657 Sling and hoist, attach to Brackets (PWA 85751) on diffuser case. Raise diffuser case and position over PWA 86508 or PWA 85044 Build Stand. Align fuel distribution valve and bracket with large clearance slot in support detail of build stand. Lower case to build stand and secure with clamp details. Remove sling, adapter and brackets.

(2) Remove fuel distribution valve. See Figure 501.

(a) Install two work bolts (501/1), washers (501/2) and nuts (501/3) to secure bracket (501/8) to diffuser case at Flange K (501/10).

CAUTION: BE PREPARED TO SUPPORT WEIGHT OF FUEL DISTRIBUTION VALVE WHEN BOLTS ARE REMOVED. USE CARE WHEN REMOVING VALVE FROM BRACKET TO ENSURE THAT EIGHT SMALL TRANSFER TUBES BETWEEN VALVE AND FUEL TUBES ARE NOT DROPPED OR DAMAGED.

(b) Remove four bolts (501/9) securing fuel distribution valve (501/7) and bracket (501/11) (Post SB PW4ENG 73-164) to bracket (501/8). Using two jackscrews installed in threaded holes in valve, remove valve from bracket.

(c) Remove each of the eight transfer tubes (501/5) from the fuel distribution valve (501/7) as follows:

1 Remove and discard the packing (501/4) from the exposed end of each of the eight transfer tubes (501/5).

2 Engage PWA 104096 Puller with the exposed packing groove on the transfer tube to be removed.

3 Apply hand pressure to the puller handles and pull the transfer tube out of the distribution valve (501/7).

4 Remove and discard the remaining packing (501/6) from each transfer tube (501/5).

(d) Place fuel distribution valve (501/7) in protective closure.

(e) Remove jackscrews.

Subtask 72−41−00−030−070:

(3) Remove Flange K brackets and fuel supply tube clamps.

(a) Remove bolts and nuts from clamps securing eight brackets to fuel supply tubes around diffuser case and remove brackets.

(b) Remove all clamps from fuel supply tubes around diffuser case.

(4) Remove fuel supply tubes.

(a) Remove lockwire and eight nuts (502/5) securing fuel supply tubes to fuel flow divider bracket (502/4). See Figure 502.

(b) Remove lockwire from each fuel supply tube nut (502/3) and fuel manifold assembly nut (502/1) and carefully remove each of eight fuel supply tubes (502/6).

(c) Remove each of the eight transfer tubes (502/10) from the fuel supply tubes as follows:

1 Remove and discard the packing (502/2) from the exposed end of each of the eight transfer tubes (502/10).

2 Engage PWA 104096 Puller with the exposed packing groove on the transfer tube to be removed.

3 Apply hand pressure to the puller handles and pull the transfer tube out of the fuel supply tube.

4 Remove and discard the remaining packing (502/2) from each transfer tube (502/10).

(5) Remove two bolts (502/9), washers (502/8) and nuts (502/7) securing fuel flow divider bracket to Flange K and remove bracket.

DIFFUSER AND COMBUSTOR - DISASSEMBLY-02

Task 72-41-00-030-002:

1. Disassemble Diffuser And Combustor Internals

A. Prerequisites

(1) Remove fuel distribution valve and fuel supply tubes. See Disassembly-01 (Task 72-41-00-030-001).

B. Equipment And Materials Required

Standard Tools:
0.190-32 UNF-2B Jackscrews, 6 Necessary
0.250-28 UNF-3B Jackscrews, 4 Necessary

Special Tools:

PWA 25039	Stand
PWA 27918	Sling (Optional To PWA 80555)
PWA 28657	Sling
PWA 76154	Adapter
PWA 80555	Sling
PWA 85044	Stand (Optional To PWA 86508)
PWA 85047	Puller (Optional To PWA 86103 Or PWA 85627)
PWA 85627	Puller, Knocker (Optional To PWA 86103)
PWA 85751	Brackets (Two Necessary)
PWA 85983	Adapter, Stabilizer (Two Necessary, Twin Overhead Rail System Only)
PWA 86103	Puller, Knocker
PWA 86508	Build Stand
PWA 87006	Adapter, Wrench
PWA 88725	Puller, Knocker
PWA 103081	Adapter, Torque

C. Procedure

Subtask 72-41-00-030-051:

(1) Remove fuel injector supply manifold assemblies as follows. See Figure 501.

(a) Remove lockwire or safety cable and loosen tube nuts (501/1) securing fuel injector supply manifold assemblies (501/2) to fuel injectors. Carefully remove eight manifold assemblies from around case. Discard packings (501/3).

Subtask 72-41-00-030-052:

(2) Remove fuel injector and support assemblies as follows. See Figure 502.

(a) Remove lockwire or safety cable, loosen and remove bolts securing fuel injector assemblies and brackets to diffuser case. Continue around diffuser case and remove all 24 fuel injector assemblies and brackets. Discard injector gaskets.

NOTE: Rotate and/or tilt injector as required to disengage injector from diffuser case. Mark location of removed injectors and brackets to facilitate reassembly.

(3) Remove diffuser case externals as follows. See Figure 503.

(a) Remove the lockwire or safety cable and bolts that attach the brackets to the case. Remove the brackets.

NOTE: You can mark the brackets with the reference numbers, per Figure 503, for ease of assembly.

(b) Remove the lockwire or safety cable, two bolts.

(c) Remove the lockwire or safety cable, four bolts (503/13) and washers (503/12) at 10 and 11:30 o'clock positions.

(d) Remove the lockwire or safety cable, six borescope plugs (503/18) or (503/18A) and gaskets (503/17) at 1:30, 4:30, 5:30, 7:30, 9 and 11 o'clock positions.

(e) Remove the two adapters (503/15) and gaskets (503/16) at 12:30 and 1:30 o'clock positions.

(f) Remove the lockwire or safety cable and six bolts (503/21) that attach the two covers (503/23) at 2 and 7:30 o'clock positions. Remove the covers and gaskets (503/22). Remove the plug (503/27) and adapter (503/19) from the covers.

(g) (Pre SB PW4ENG 72−699) Remove the lockwire, bolts (503/30), cover (503/29) and gasket (503/28) that are at 9:30 o'clock. Discard the gasket.

(4) Remove EEC thermocouple probe (503/25) as follows.

(a) Remove lockwire or safety cable securing probe body nut to diffuser case. Do not remove lockwire securing coupling nut to probe body nut (see note). Loosen body nut from diffuser case boss and remove probe. Remove and discard gasket.

NOTE: To avoid loss of small detail washer, do not remove body nut from probe.

Subtask 72−41−00−030−053:

(5) Remove igniter plugs as follows.

(a) Remove two igniter plugs (504/1) and igniter bosses (504/3), spacers (504/4) and key washers (504/2) from diffuser case. Discard key washers. See Figure 504.

Subtask 72−41−00−030−054:

(6) Remove outer combustion chamber as follows. See Figure 505.

(a) Attach PWA 27918 Sling or PWA 80555 Sling (505/1) and hoist to outer combustion chamber assembly (505/2) engaging three holes in the rear of the chamber. Take up strain on hoist to support weight of combustion chamber eliminating slack in cables.

CAUTION: ENSURE BORESCOPE PLUG HAS BEEN REMOVED FROM DIFFUSER CASE. FAILURE TO REMOVE BORESCOPE PLUG WILL RESULT IN DAMAGE TO OUTER LINER AND PLUG.

(b) Loosen and remove bolts (505/3) and washers (505/4) at twelve locations around diffuser case.

(c) Remove combustion chamber assembly vertically from diffuser case and place on pallet. Remove hoist and sling.

Subtask 72−41−00−030−055:

(7) Install the diffuser case in a stand.

(a) Install two PWA 85751 Handling Brackets to diffuser case as follows. See Figure 506.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapter with PWA 85751 Brackets.

1 Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

2 Position double spool bracket in front most two holes as marked on bracket.

WARNING: USE TWO OPERATORS WHEN INSTALLING OR TRUNNIONING CASE IN STAND. WHEN QUICK RELEASE PIN IS REMOVED, CASE MAY TRUNNION BY ITSELF, AND POSSIBLY CAUSE INJURY.

(b) Using hoist, PWA 28657 Sling and PWA 76154 Adapters, remove diffuser case from PWA 86508 or PWA 85044 Stand. Trunnion case and install into PWA 25039 Stand. Secure with quick release pin.

(c) Remove hoist, PWA 28657 Sling and PWA 76154 Adapters.

(8) (Pre SB PW4ENG 72−572) Remove Stage 15 HPC stator as follows. See Figure 507 (Sheet 1).

(a) Loosen and remove bolts (507/6), washers (507/3), spacer plates (507/5), injectors (507/4) and nuts (507/7).

(b) For engines which have stator assembly with outer shroud hook (Pre SB PW4ENG 72−234) installed. Remove stator assembly (507/2) with PWA 85047 Puller. Discard gasket if gasket has not been removed as stated in SB PW4ENG 72−141.

CAUTION: USE CARE NOT TO DAMAGE STAGE 15 HPC AIRSEALING RING WITH PWA 85627 PULLER.

(c) For engines which have stator assembly without outer shroud hook (Post SB PW4ENG 72−234) installed. Remove stator assembly and Stage 15 HPC airsealing ring assembly together with PWA 86103 Puller or PWA 85627 Puller as follows.

1 Hook the puller under the airsealing ring. Make sure the puller is engaged at 90 degrees to the airsealing ring.

2 Quickly move the puller hammer away from ring at different locations around the inner diameter of the airsealing ring until the ring is loosened.

3 Separate stator from airsealing ring and discard gasket if gasket has not been removed as stated in SB PW4ENG 72−141.

(d) (Post SB PW4ENG 72−464) Remove the stator assembly. Use six 0.190−32 UNF−2B jackscrews.

(e) For engines which have the stator assembly removed before this step. Remove Stage 15 HPC airsealing ring assembly (507/1) from diffuser case with PWA 86103 Puller or PWA 85627 Puller as follows.

1 Hook the puller under the airsealing ring. Make sure the puller is engaged at 90 degrees to the airsealing ring.

2 Quickly move the puller hammer away from ring at different locations around the inner diameter of the airsealing ring until the ring is loosened.

(9) (Post SB PW4ENG 72−572) Remove HPC exit brush seal support assembly and HPC exit stator assembly as follows. See Figure 507 (Sheet 2).

(a) Loosen and remove bolts (507/6), washers (507/3), spacer plates (507/5), injectors (507/4) and nuts (507/7).

(b) (Stator without jackscrew holes). Remove the stator assembly (510/2) with PWA 88725 Puller Knocker.

(c) (Stator with jackscrew holes). Remove the stator assembly (510/2). Use six 0.190−32 UNF−2B jackscrews.

(d) Remove the HPC exit brush seal support assembly (510/1). Use six 0.190−32 UNF−2B jackscrews.

Subtask 72−41−00−030−056:

(10) Remove No. 3 bearing pressure tube and airframe manifold assembly plate locks and gaskets as follows. See Figure 508.

(a) (Pre SB PW4ENG 72−570) No No. 3 bearing weep tube heat shield assembly installed.

1 Remove lockwire or safety cable.

2 Loosen and remove bolts (508/6) and (508/15), lockplate (508/8), sleeve (508/7) and gasket (508/9) that attach the manifold assembly to the diffuser case.

(b) (Post SB PW4ENG 72−570) No. 3 bearing weep tube heat shield assembly installed.

1 Remove lockwire or safety cable.

2 Loosen and remove bolts (508/17) and (508/18), heat shield (508/16), lockplate (508/8), sleeve (508/7) and gasket (508/9) that attach the manifold assembly to the diffuser case.

(c) Remove lockwire or safety cable, loosen and remove bolts (508/2), cap (508/1), lock plate (508/3), sleeve (508/4) and gasket (508/5).

(d) Remove lockwire or safety cable, loosen and remove bolts (508/13), shield (508/12), lock plate (508/11), sleeve (508/14) and gasket (508/10).

Subtask 72−41−00−030−057:

(11) (Pre SB PW4ENG 72−567) Remove the mating parts for the No. 3 bearing (breather) tube (509/1), the No. 3 bearing (compartment) cooling tube (509/2), and the No. 3 bearing (scavenge) tube. See Figure 509.

(a) At the No. 3 bearing (breather) tube location (509/1), remove the thrust wire, tube nut, and plate. If applicable, remove the sleeve and gasket. Discard the gasket. Remove the packing holder.

(b) At the No. 3 bearing (compartment) cooling tube location (509/2), remove the adapter and washer. Remove the lockwire and bolts from the elbow. Remove the two gaskets and the lock. Discard the gaskets.

(c) At the No. 3 bearing (scavenge) tube location (509/3), remove the thrust wire, tube nut, plate, sleeve, gasket, and packing holder. Discard the gasket.

(12) (Post SB PW4ENG 72−567) Remove the mating parts for the No. 3 bearing (breather) tube, the No. 3 bearing (compartment) cooling tube, and the No. 3 bearing (scavenge) tube. See Figure 510.

(a) (Pre SB PW4ENG 72−569) Remove thrust wire (510/1) and tube nut (510/2), lockwire or safety cable and bolts (510/3), plate−lock (510/4), sleeve (510/5) and gasket (510/6). Discard the gasket.

(b) (Post SB PW4ENG 72−569) Remove the thrust wire (510/1) and the tube nut (510/2), lockwire or safety cable and bolts (510/21), heat shield (510/20), plate−lock (510/4), sleeve (510/5), and gasket (510/6). Discard the gasket.

(c) Remove the adapter (510/19) and washer (510/18, lockwire or safety cable and bolts (510/13), elbow (510/14), two gaskets (510/15 and 510/17), and locks (510/16). Discard the gaskets.

(d) Remove the thrust wire (510/11) and tube nut (510/10), lockwire or safety cable and bolts (510/12), plate (510/9), sleeve (510/8), and gasket (510/7). Discard the gasket.

(13) (Pre SB PW4ENG 72−567) Remove the diffuser seal air vent (elbow) tube assembly. See Figure 511.

(a) Remove lockwire or safety cable, loosen and remove the bolts and bracket that are installed in the flange of the tube.

(b) Remove the tube and the gasket. Discard the gasket.

Subtask 72−41−00−030−058:

(14) Remove the heat shields from the No. 3 bearing (breather) tube (512/1), No. 3 bearing (compartment) cooling tube (512/2), No. 3 bearing (oil) pressure tube (512/3), and No. 3 bearing (scavenge) tube assemblies as follows. See Figure 512.

(a) Remove lockwire from the middle and both ends of the (outer) heat shields.

(b) Remove the (outer) heat shield halves. Remove the (inner) heat shield halves.

(c) Remove the (flange) heat shield halves.

(d) Remove the lockwire and bolts that attach three of the tubes to the airsealing ring.

Subtask 72−41−00−030−059:

(15) Remove No. 3 bearing front seal, cooling duct and housing as follows. See Figure 513.

(a) Remove four screws securing duct and housing to diffuser case.

(b) Install four 0.250−28 UNF−3B Jackscrews to the housing flange and tighten until the housing is loosened from the diffuser case.

(c) Remove duct and housing from diffuser case.

Subtask 72−41−00−030−060:

(16) Remove No. 3 bearing oil vent (inner) tube assembly as follows. See Figure 514.

(a) Remove lockwire and loosen tube nut (514/9) on No. 3 bearing oil vent (inner) tube assembly (514/3).

NOTE: Hold connector on mating tube with PWA 87006 Wrench while you loosen tube nut (514/9)) with PWA 103081 Torque Adapter.

(b) Remove screws (514/7), nuts (514/8), brackets (513/6) and clamps (514/5) from two locations on tube assembly (514/3).

(c) Remove tube assembly from diffuser case and remove seal ring (514/4) from tube assembly.

Subtask 72−41−00−030−066:

(17) Remove turbine cooling duct sensing (inner airframe) tube assembly as follows. See Figure 514.

(a) Remove lockwire and loosen tube nut (514/10) on turbine cooling duct sensing (inner airframe) tube assembly (514/1). Remove tube assembly from diffuser case.

NOTE: Hold connector on mating tube with PWA 87006 Wrench while you loosen tube nut (514/10)) with PWA 103081 Torque Adapter.

(b) Remove seal ring (514/2) from tube assembly (514/1).

Subtask 72−41−00−030−061:

(18) Remove diffuser airsealing ring assembly as follows. See Figure 515.

(a) Remove No. 3 bearing packing transfer (breather and scavenge) tubes (515/2) at two locations in airsealing ring (515/10). Remove seal ring (515/5) from transfer tubes.

(b) Remove packing transfer (oil pressure) tube (515/9) from airsealing ring. Remove seal ring (515/8) from transfer tube.

(c) Remove seal ring transfer (No. 3 bearing cooling rear) tube (515/3). Remove seal ring (515/7) from transfer tube.

(d) Remove seal ring transfer (No. 3 bearing cooling front) tube (515/6). Remove seal ring (515/4) from transfer tube.

(e) Remove 36 bolts (515/1) and nuts (515/11) securing airsealing ring assembly to diffuser case and remove airsealing ring assembly.

Subtask 72−41−00−030−062−A:

(19) (Pre SB PW4ENG 72−567) Remove No. 3 bearing (oil) pressure tube assembly as follows. See Figure 516.

(a) Carefully remove tube assembly (516/10) from diffuser case.

(b) Remove seal rings, (516/1), (516/2), and (516/3) and gasket (516/4) from tube assembly (516/10).

Subtask 72−41−00−030−063−A:

(20) (Pre SB PW4ENG 72−567) Remove No. 3 bearing and airframe (oil vent and turbine cooling air duct sensing outer) manifold assemblies as follows. See Figure 516.

(a) Carefully remove manifold assemblies (516/6) from two locations in diffuser case.

(b) Remove seal rings (516/5) from manifold assemblies (516/6).

Subtask 72−41−00−030−065−A:

(21) (Pre SB PW4ENG 72−567) Remove No. 3 bearing (compartment) cooling tube assembly as follows. See Figure 516.

(a) Carefully remove tube assembly (516/9) from diffuser case.

(b) Remove seal rings (516/7) and (516/8).

Subtask 72−41−00−030−067−A:

(22) (Pre SB PW4ENG 72−567) Remove the turbine blade cooling tube assemblies (517/1) and (517/4), diffuser seal air vent tube assembly (517/2), No. 3 bearing (scavenge) tube assembly (517/3), and No. 3 bearing (breather) tube assembly (517/5).

(a) Carefully remove the tube assemblies from the diffuser case.

(b) Remove the gaskets.

(c) Remove the seal rings.

Subtask 72−41−00−030−062−B:

(23) (Post SB PW4ENG 72−567) Remove No. 3 bearing (oil) pressure tube assembly as follows. See Figure 518.

(a) Carefully remove tube assembly (518/3) from diffuser case.

(b) Remove seal rings, (518/1), (518/2), (518/6) and (518/4) from tube assembly (518/3).

Subtask 72−41−00−030−063−B:

(24) (Post SB PW4ENG 72−567) Remove No. 3 bearing and airframe (oil vent and turbine cooling air duct sensing outer) manifold assemblies as follows. See Figure 518.

(a) Carefully remove manifold assemblies (518/5) from two locations in diffuser case.

(b) Remove seal rings (518/6) from manifold assemblies (518/5).

Subtask 72−41−00−030−064:

(25) (Post SB PW4ENG 72−567) Remove No. 3 bearing (breather and scavenge) tube assemblies as follows. See Figure 519.

(a) Carefully remove tube assemblies (519/1) from diffuser case.

(b) Remove seal rings (519/5) and (519/3).

(c) Remove and discard gaskets (519/4).

Subtask 72−41−00−030−065−B:

(26) (Post SB PW4ENG 72−567) Remove No. 3 bearing (compartment) cooling tube assembly as follows. See Figure 519.

(a) Carefully remove tube assembly (519/8) from diffuser case.

(b) Remove seal rings (519/6) and (519/7).

Subtask 72−41−00−030−094:

(27) (Post SB PW4ENG 72−567) Remove diffuser seal air vent tube assemblies as follows. See Figure 519.

(a) Carefully remove diffuser seal air vent tube assemblies (519/9) from diffuser case.

(b) Remove seal rings (519/10) from tube assemblies.

Subtask 72−41−00−030−067−B:

(28) (Post SB PW4ENG 72−567) Remove turbine blade cooling tubes as follows. See Figure 520.

(a) Carefully remove turbine blade cooling tubes (520/1) from two locations in diffuser case.

(b) Remove transfer tubes (520/4) from cooling tubes (520/1). Remove seal rings (520/3) from both ends of each transfer tube (520/4).

(c) Remove seal rings (520/2) from each cooling tube.

(29) Position diffuser case on pallet, front end down Remove two PWA 85751 Handling Brackets from case.

DIFFUSER AND COMBUSTOR − DISASSEMBLY−02

Task 72−41−00−030−005:

1. Disassemble Diffuser And Combustor Internals

A. Prerequisites

(1) Remove fuel distribution valve and fuel supply tubes. See Disassembly−01 (Task 72−41−00−030−001).

B. Equipment And Materials Required

Standard Tools:
0.190−32 UNF−2B Jackscrews, 6 Necessary
0.250−28 UNF−3B Jackscrews, 4 Necessary

Special Tools:

PWA 25039	Stand
PWA 27918	Sling (Optional To PWA 80555)
PWA 28657	Sling
PWA 76154	Adapter
PWA 80555	Sling
PWA 85044	Stand (Optional To PWA 86508)
PWA 85047	Puller (Optional To PWA 86103 Or PWA 85627)
PWA 85751	Brackets (Two Necessary)
PWA 85983	Adapter, Stabilizer (Two Necessary, Twin Overhead Rail System Only)
PWA 86508	Build Stand
PWA 87006	Adapter, Wrench
PWA 88725	Puller, Knocker
PWA 103081	Adapter, Torque

C. Procedure

Subtask 72−41−00−030−075:

(1) Remove fuel injector supply manifold assemblies as follows. See Figure 501.

(a) Remove lockwire and loosen tube nuts (501/1) securing fuel injector supply manifold assemblies (501/2) to fuel injectors. Carefully remove eight manifold assemblies from around case. Discard packings (501/3).

Subtask 72−41−00−030−076:

(2) Remove fuel injector and support assemblies as follows. See Figure 502.

NOTE: Clock positions are clockwise from the rear.

(a) Remove lockwire, loosen and remove bolts securing fuel injector assemblies and brackets to diffuser case. Continue around diffuser case and remove all 24 fuel injector assemblies and brackets. Discard injector gaskets.

NOTE: Rotate and/or tilt injector as required to disengage injector from diffuser case. Mark location of removed injectors and brackets to facilitate reassembly.

(3) Remove diffuser case externals as follows.

NOTE: Clock positions are clockwise from the rear.

(a) Remove the lockwire and bolts that attach the brackets and cover to the case. Remove the brackets. See Figure 503 and Figure 504.

NOTE: You can mark the brackets with the reference numbers, Figures 503 and 504, for ease of assembly.

(b) Remove the lockwire, two bolts (503/2) and washers (503/1) at 1 o'clock position.

(c) (Pre SB PW4ENG 72−699) Remove the lockwire, bolts (504/7), cover (504/6) and gasket (504/5) that are at 9:30 o'clock. Discard the gasket.

(d) (Pre SB PW4ENG 72−559 only) Remove the adapter (505/4) and gasket (505/3), lockwire and bolts (505/5), cover (505/2) and gasket (505/1) from the case at 12:30 o'clock. Discard the gaskets. See Figure 505.

(e) Remove the adapter (505/10) and gasket (505/9), lockwire and bolts (505/11), cover (505/8) and gasket (505/12) that are at 2:00 o'clock. Discard the gaskets.

(f) Remove the adapter (505/14) and gasket (505/13) that are at 3:00 o'clock. Discard the gasket.

(g) (Pre SB PW4ENG 72−559) Remove the lockwire, three borescope plugs (505/7) and gaskets (505/6) at 1:30, 4:15 and 5:45 o'clock positions. Discard the gaskets. Remove the lockwire, three borescope plugs (506/7) and gaskets (506/6) that are at the 7:30, 9:15 and the 11 o'clock positions. Discard the gaskets. See Figure 505 and Figure 506.

(h) (Post SB PW4ENG 72−559) Remove the lockwire, two borescope plugs (505/7) and gaskets (505/6) at 1:30 and 4:15 o'clock positions. Discard the gaskets. Remove the lockwire, three borescope plugs (506/7) and gaskets (506/6) that are at the 7:30, 9:15 and 11 o'clock positions. Discard the gaskets. See Figure 505 and Figure 506.

(i) Remove the lockwire and two additional plugs (505/18) and (506/2) and gaskets (505/17) and (506/1), one at 5:00 o'clock and the other at 7:00 o'clock.

(j) Remove the lockwire, bolts (506/3), cover (506/4) and gasket (506/5) that are at 7:30 o'clock. See Figure 506.

(4) Remove EEC thermocouple probe (505/15) as follows. See Figure 505.

(a) Remove lockwire securing probe body nut to diffuser case. Do not remove lockwire securing coupling nut to probe body nut (see note). Loosen body nut from diffuser case boss and remove probe. Remove and discard gasket (505/16).

NOTE: To avoid loss of small detail washer, do not remove body nut from probe.

Subtask 72−41−00−030−077:

(5) Remove igniter plugs as follows. See Figure 507.

(a) Remove two igniter plugs (507/1) and igniter bosses (507/3), spacers (507/4) and key washers (507/2) from diffuser case. Discard key washers.

Subtask 72−41−00−030−078:

(6) Remove outer combustion chamber as follows. See Figure 508.

DIFFUSER AND COMBUSTOR − DISASSEMBLY−02

(a) Attach PWA 27918 Sling or PWA 80555 Sling (508/1) and hoist to outer combustion chamber assembly (508/2) engaging three holes in the rear of the chamber. Take up strain on hoist to support weight of combustion chamber eliminating slack in cables.

CAUTION: ENSURE BORESCOPE PLUGS HAVE BEEN REMOVED FROM DIFFUSER CASE. FAILURE TO REMOVE BORESCOPE PLUGS WILL RESULT IN DAMAGE TO OUTER LINER AND PLUGS.

(b) Loosen and remove bolts (508/3) and washers (508/4) at twelve locations around diffuser case.

(c) Remove combustion chamber assembly vertically from diffuser case and place on pallet. Remove hoist and sling.

(7) Install the diffuser case on PWA 25039 Stand as follows. See Figure 509.

(a) Install two PWA 85751 Handling Brackets to diffuser case as follows.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapter with Brackets PWA 85751.

1 Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

2 Position double spool bracket in front most two holes as marked on bracket.

DIFFUSER AND COMBUSTOR − DISASSEMBLY−02

WARNING: USE TWO OPERATORS WHEN INSTALLING OR TRUNNIONING CASE IN STAND. WHEN QUICK RELEASE PIN IS REMOVED, CASE MAY TRUNNION BY ITSELF, AND POSSIBLY CAUSE INJURY.

(b) Using hoist, PWA 28657 Sling and PWA 76154 Adapters, remove diffuser case from PWA 86508 or PWA 85044 Stand. Trunnion case and install into PWA 25039 Stand. Secure with quick release pin.

(c) Remove hoist, PWA 28657 Sling and PWA 76154 Adapters.

Subtask 72−41−00−030−079:

(8) Remove the compressor exit stator assembly as follows. See Figure 510.

(a) Loosen and remove bolts (510/6), washers (510/3), spacer plates (510/5), injectors (510/4) and nuts (510/7).

(b) (Stators without jackscrew holes). Remove the stator with PWA 88725 Puller Knocker.

(c) (Stators with jackscrew holes). Remove the stator assembly (510/2). Use six 0.190−32 UNF−2B jackscrews.

Subtask 72−41−00−030−080:

(9) Remove the HPC exit brush seal support assembly (510/1). Use six 0.190−32 UNF−2B jackscrews.

Subtask 72−41−00−030−081:

(10) Remove No. 3 bearing pressure tube, airframe manifold assemblies and covers as follows. See Figure 511.

(a) (Pre SB PW4ENG 72−570) No No. 3 bearing weep tube heat shield assembly installed.

1 Remove lockwire.

2 Loosen and remove bolts (511/6) and (511/22), lockplate (511/8), sleeve (511/7) and gasket (511/9) that attach the manifold assembly to the diffuser case.

(b) (Post SB PW4ENG 72−570) No. 3 bearing weep tube heat shield assembly installed.

1 Remove lockwire.

2 Loosen and remove bolts (511/24) and (511/25), heat shield (511/23), lockplate (511/8), sleeve (511/7) and gasket (511/9) that attach the manifold assembly to the diffuser case.

(c) Remove lockwire, loosen and remove bolts (511/2), cap (511/1), plate lock (511/3), sleeve (511/4) and gasket (511/5). Discard the gasket.

(d) Remove lockwire, loosen and remove bolts (511/13), shield (511/12), plate lock (511/11), sleeve (511/14) and gasket (511/10). Discard the gasket.

(e) (Pre SB PW4ENG 72−559) At two locations, remove the nuts (511/20) and seals (511/19). Remove the seal rings (511/18) from the seals. Remove the lockwire, bolts (511/17), bracket (511/21) (at one location), covers (511/16) and gaskets (511/15). Discard the gaskets.

(f) (Post SB PW4ENG 72−559) Remove the nut (511/20) and seal (511/19). Remove the seal ring (511/18) from the seal. Remove the lockwire, bolts (511/17), bracket (511/21), cover (511/16) and gasket (511/15). Discard the gasket.

Subtask 72−41−00−030−082:

(11) Remove No. 3 bearing breather, scavenge, and cooling tube assembly locks. See Figure 512.

(a) (Pre SB PW4ENG 72−569) Remove thrust wire (512/1) and tube nut (512/2), lockwire or safety cable and bolts (512/3), plate−lock (512/4), sleeve (512/5) and gasket (512/6). Discard the gasket.

(b) (Post SB PW4ENG 72−569) Remove the thrust wire (512/1) and tube nut (512/2), lockwire or safety cable and bolts (512/21), heat shield (512/20), plate−lock (512/4), sleeve (512/5) and gasket (512/6). Discard the gasket.

(c) Remove the adapter (512/19) and washer (512/18), lockwire or safety cable and bolts (512/13), elbow (512/14), two gaskets (512/15) and (512/17) and locks (512/16). Discard the gaskets.

(d) Remove thrust wire (512/11) and tube nut (512/10), lockwire or safety cable and bolts (512/12), plate (512/9), sleeve (512/8) and gasket (512/7). Discard the gasket.

Subtask 72−41−00−030−083:

(12) Remove the heat shields from the No. 3 bearing (breather) tube (513/1), No. 3 bearing (compartment) cooling tube (513/2), No. 3 bearing (oil) pressure tube (513/3) and No. 3 bearing (scavenge) tube assemblies as follows (513/4). See Figure 513.

(a) Remove lockwire from the middle and both ends of the (outer) heat shields.

(b) Remove the (outer) heat shield halves. Remove the (inner) heat shield halves.

(c) Remove the (flange) heat shield halves.

(d) Remove the lockwire and bolts that attach three of the tubes to the airsealing ring.

Subtask 72−41−00−030−084:

(13) Remove No. 3 bearing front seal, cooling duct and housing as follows. See Figure 514.

(a) Remove four screws securing duct and housing to diffuser case.

(b) Install four 0.250−28 UNF−3B Jackscrews to the housing flange and tighten until the housing is loosened from the diffuser case.

(c) Remove duct and housing from diffuser case.

Subtask 72−41−00−030−085:

(14) Remove No. 3 bearing oil vent (inner) tube assembly as follows. See Figure 515.

(a) Remove lockwire and loosen tube nut (515/9) on No. 3 bearing oil vent (inner) tube assembly (515/3).

NOTE: Hold connector on mating tube with PWA 87006 Wrench while you loosen tube nut (515/9) with PWA 103081 Torque Adapter.

(b) Remove screws (515/7), nuts (515/8), brackets (515/6) and clamps (515/5) from two locations on tube assembly (515/3).

(c) Remove tube assembly from diffuser case and remove seal ring (515/4) from tube assembly.

Subtask 72−41−00−030−086:

(15) Remove turbine cooling duct sensing (inner airframe) tube assembly as follows.

(a) Remove lockwire and loosen tube nut (515/10) on turbine cooling duct sensing (inner airframe) tube assembly (515/1). Remove tube assembly from diffuser case.

NOTE: Hold connector on mating tube with PWA 87006 Wrench while you loosen tube nut (515/10) with PWA 103081 Torque Adapter.

(b) Remove seal ring (515/2) from tube assembly (515/1).

Subtask 72−41−00−030−087:

(16) Remove the HPC (rear) exit brush seal assembly as follows. See Figure 516.

(a) Remove No. 3 bearing packing transfer (breather and scavenge) tubes (516/2) at two locations in the brush seal (516/10). Remove seal ring (516/5) from transfer tubes.

(b) Remove packing transfer (oil pressure) tube (516/9) from the brush seal. Remove seal ring (516/8) from transfer tube.

(c) Remove seal ring transfer (No. 3 bearing cooling rear) tube (516/3). Remove seal ring (516/7) from transfer tube.

(d) Remove seal ring transfer (No. 3 bearing cooling front) tube (516/6). Remove seal ring (516/4) from transfer tube.

(e) Remove 36 bolts (516/1) and nuts (516/11) securing brush seal assembly to diffuser case. Remove the brush seal assembly (516/10).

Subtask 72−41−00−030−088:

(17) Remove No. 3 bearing (oil) pressure tube assembly as follows. See Figure 517.

(a) Carefully remove tube assembly (517/3) from diffuser case.

(b) Remove seal rings, (517/1), (517/2), (517/6) and (517/4) from tube assembly (517/3).

Subtask 72−41−00−030−089:

(18) Remove No. 3 bearing and airframe (oil vent and turbine cooling air duct sensing outer) manifold assemblies as follows. See Figure 517.

(a) Carefully remove manifold assemblies (517/5) from two locations in diffuser case.

(b) Remove seal rings (517/6) from manifold assemblies (517/5).

Subtask 72−41−00−030−090:

(19) Remove No. 3 bearing (breather and scavenge) tube assemblies as follows. See Figure 518.

(a) Carefully remove tube assemblies (518/1) from diffuser case.

(b) Remove seal rings (518/5) and (518/3).

(c) Remove and discard gaskets (518/4).

Subtask 72−41−00−030−091:

(20) Remove No. 3 bearing (compartment) cooling tube assembly as follows. See Figure 518.

(a) Carefully remove tube assembly (518/8) from diffuser case.

(b) Remove seal rings (518/6) and (518/7).

Subtask 72−41−00−030−092:

(21) Remove diffuser seal air vent tube assemblies as follows. See Figure 518.

(a) Carefully remove diffuser seal air vent tube assemblies (518/9) from diffuser case.

(b) Remove seal rings (518/10) from tube assemblies.

Subtask 72−41−00−030−093:

(22) Remove turbine blade cooling tubes as follows. See Figure 519.

(a) Carefully remove turbine blade cooling tubes (519/1) from two locations in diffuser case.

(b) Remove transfer tubes (519/4) from cooling tubes (519/1). Remove seal rings (519/3) from both ends of each transfer tube (519/4).

(c) Remove seal rings (519/2) from each cooling tube.

(23) Position diffuser case on pallet, front end down. Remove two Handling Brackets PWA 85751 from case.

DIFFUSER AND COMBUSTOR - DISASSEMBLY-03

Task 72-41-00-030-003-001:

1. Disassemble No. 3 Bearing Duct And Housing (Hydraulic Wrench Method)

NOTE: To disassemble No. 3 bearing duct and housing by means of mechanical wrench method, see Disassembly-04 (Task 72-41-00-030-003-002).

A. Prerequisites
  (1) Remove fuel distribution valve and fuel supply tubes. See Disassembly-01 (Task 72-41-00-030-001).
  (2) Remove diffuser and combustor externals. See Disassembly-02 (Task 72-41-00-030-002).

B. Equipment And Materials Required

Special Tools:
PWA 18872 Wrench, Hydraulic*
PWA 28814 Pump, Electric*
PWA 28815 Cart*
PWA 29510 Pump, Hydraulic*
PWA 33732 Wrench, Hydraulic*
PWA 75046 Cart*
PWA 80070 Wrench, Hydraulic*
PWA 85048 Base
PWA 85050 Drift
PWA 85051 Adapter, Wrench*
PWA 85052 Wrench, Torque*
PWA 85053 Wrench, Torque*
PWA 85054 Adapter, Wrench*
PWA 85058 Puller
PWA 85059 Eye
PWA 85167 Adapter
PWA 85199 Fixture
PWA 85541 Wrench
PWA 85542 Wrench
PWA 86546 Adapter (Optional To PWA 85199)
PWA 87354 Wrench, Hydraulic*

*Refer to Table 501 for tool options. Only Table 501 shows the correct combination of tools for removal of the No. 3 bearing (outer race) retaining nut.

NOTE: The PWA 86546 Adapter is an optional tool that will permit PWA 85167 Adapter to be mounted to an approved bench positioner when the electric motorized PWA 85199 Fixture is not available.

C. Procedure

Subtask 72−41−00−030−068:

(1) Disassemble No. 3 bearing seal assembly and front cooling duct assembly. See Figure 501.
  (a) Remove Protective Cover (PWA 85056) over No. 3 bearing outer race and attach PWA 85059 Lifting Eye.
  (b) Install seal assembly (501/11) in PWA 85167 Adapter (501/10) attached to PWA 85199 Fixture (501/5). Secure with eight bolts (501/7) and remove lifting eye.
  (c) Attach PWA 85058 Puller (inner assembly) (501/9) to seal assembly. Secure with eight screws (501/8).
  (d) Remove four bolts (501/21) and key washers (501/20) securing shield (501/19) to seal assembly. Remove shield and discard key washers.
  (e) Remove heat shield (501/18) from elbow (501/13).
  (f) Remove bolt (501/14) and nut (501/12) securing elbow (501/13) lug to clevis on seal assembly.
  (g) Remove two bolts (501/17) and key washers (501/15) securing elbow (501/13) and heat shield (501/16) to seal assembly (501/11). Remove elbow and discard key washers.
  (h) Remove locks (501/6) at three locations on seal assembly (501/11).
  (i) With PWA 85541 Wrench remove the two large nuts (501/4) and with PWA 85542 Wrench remove the small nut (501/4) on seal assembly (501/11).
  (j) Remove nine bolts (501/2) and washers (501/3) securing cooling duct to seal assembly (501/11).
  (k) Attach PWA 85058 Puller (outer assembly) (501/1) split ring to duct outer flange.
  (l) Tighten the puller, jamnuts and the center bolt of the toggle pad evenly to remove the cooling duct from the bearing housing.
  (m) Rotate adapter (501/10) to large OD up position and remove puller (inner assembly) (501/9).

(2) Remove seal assembly from housing.
  (a) Remove four screws (502/5) securing seal assembly (502/1) to housing assembly (502/3). See Figure 502.
  (b) Using four jackscrews (502/4) installed in housing (502/3) remove seal assembly (502/1) from housing and place on bench large OD up.

NOTE: One or more repaired jackscrew holes may be present in the No. 3 bearing housing which will require an oversized jackscrew with a 0.3125−24 UNF−2B modified minor diameter thread.

DIFFUSER AND COMBUSTOR − DISASSEMBLY−03

(c) Locate nozzle (502/8) inside seal assembly (502/1) and remove bolts (502/9) and key washers (502/10) securing nozzle. Remove nozzle and discard key washers.

(d) Remove gasket (502/2) from housing (502/3).

(e) Rotate adapter (502/7) and housing (502/3) to large OD up position.

(f) Remove bolts (502/6) securing housing (502/3) to adapter (502/7) and using Lifting Eye (PWA 85059) remove housing from adapter.

(3) Remove the No. 3 bearing (outer race) retaining nut. Refer to Table 501 for the correct combination of tools. Refer to Figure 503.

NOTE: See 72−00−41, Removal−01 for removal of retaining nut from diffuser and combustor installed on high pressure compressor.

(a) (Method 1)

1 Install housing (503/3) in PWA 85048 Base (503/4), large OD up, aligning four pins in base with bolt holes in housing.

2 Remove rivet (503/1) from retaining nut (503/5) in housing (503/3) and discard rivet.

3 Install PWA 85051 Adapter (503/6), spline end up, over the pilot of base (503/4) and rotate to engage the four slots of the adapter (503/6) with four keys of the base (503/4).

4 Secure PWA 85052 Wrench (503/7) to a hydraulic wrench (503/2). Install them together over the adapter (503/6), engaging the slots on the outer race retaining nut (503/5).

6 Remove the adapter from Base PWA 85048.

(b) (Method 2)

1 Install the No. 3 bearing housing in PWA 85048 Base, large OD up, aligning the four pins in the base with the bolt holes in the housing.
2 Remove the rivet from the retaining nut. Discard the rivet.
3 Install PWA 85054 Adapter in the slots of the retaining nut.
4 Install PWA 85053 Torque Wrench over the adapter and on the nut, engaging the teeth of the wrench in the slots of the nut.
5 With a hoist, lift a hydraulic wrench from a cart.
6 Install the hydraulic wrench on the torque wrench.
7 Install PWA 88100 Anchor Plate on the hydraulic wrench, engaging the pins of the wrench in the holes of the anchor plate.
8 Attach the hoses of a pump on the hydraulic wrench.
9 Loosen and remove the nut.
10 Remove the wrenches and adapters.

CAUTION: WHEN YOU REMOVE THE NO. 3 BEARING OUTER RACE, YOU MUST EXAMINE THE NO. 3 BEARING HOUSING FOR SIGNS OF WEAR ON THE HOUSING SHOULDER AND JOURNAL SURFACES. SEE 72−41−10, INSPECTION/CHECK−03 AND −04 FOR SPECIFIC INSPECTION LIMITS.

(4) Remove the No. 3 bearing outer race as follows. See Figure 504.

NOTE: See 72−00−41, Removal−01, for removal of the outer race when the diffuser and combustor is installed on the high pressure compressor.

(a) Rotate housing (504/2) in Base (PWA 85048), large OD down, aligning four pins in base with bolt holes in housing.
(b) Install PWA 85050 Drift (504/1) onto housing (504/2) with three pads locating in three scallops of the housing and the bearing outer race (504/3).
(c) Using drift and standard arbor press, drift outer race from housing.
(d) Remove housing (504/2) from base and place outer race (504/3) in protective closure with mating inner race and rollers.

DIFFUSER AND COMBUSTOR - DISASSEMBLY-04

Task 72-41-00-030-003-002:

1. Disassemble No. 3 Bearing Duct And Housing (Mechanical Wrench Method)

NOTE: To disassemble No. 3 bearing duct and housing by means of hydraulic wrench method, see Disassembly-03 (Task 72-41-00-030-003-001).

A. Prerequisites
   (1) Remove fuel distribution valve and fuel supply tubes. See Disassembly-01 (Task 72-41-00-030-001).
   (2) Remove diffuser and combustor externals. See Disassembly-02 (Task 72-41-00-030-002).

B. Equipment And Materials Required

Special Tools:
PWA 45418 Wrench, Mechanical*
PWA 45419 Multiplier, Pneumatic*
PWA 80071 Multiplier, Torque*
PWA 80187 Wrench, Mechanical*
PWA 80651 Multiplier, Pneumatic*

No. 3 Bearing Seal And Duct Disassembly
Figure 501
(Task 72-41-00-030-003-002)

   - (a) Remove Protective Cover (PWA 85056) over No. 3 bearing outer race and attach PWA 85059 Lifting Eye.
   - (b) Install seal assembly (501/11) in PWA 85167 Adapter (501/10) attached to PWA 85199 Fixture (501/5). Secure with eight bolts (501/7) and remove lifting eye.
   - (c) Attach PWA 85058 Puller (inner assembly) (501/9) to seal assembly. Secure with eight screws (501/8).
   - (d) Remove four bolts (501/21) and key washers (501/20) securing shield (501/19) to seal assembly. Remove shield and discard key washers.
   - (e) Remove heat shield (501/18) from elbow (501/13).
   - (f) Remove bolt (501/14) and nut (501/12) securing elbow (501/13) lug to clevis on seal assembly.
   - (g) Remove two bolts (501/17) and key washers (501/15) securing elbow (501/13) and heat shield (501/16) to seal assembly (501/11). Remove elbow and discard key washers.
   - (h) Remove locks (501/6) at three locations on seal assembly (501/11).
   - (i) With PWA 85541 Wrench remove the two large nuts (501/4) and with PWA 85542 Wrench remove the small nut (501/4) on seal assembly (501/11).
   - (j) Remove nine bolts (501/2) and washers (501/3) securing cooling duct to seal assembly (501/11).
   - (k) Attach PWA 85058 Puller (outer assembly) (501/1) split ring to duct outer flange.
   - (l) Tighten the puller, jamnuts and the center bolt of the toggle pad evenly to remove the cooling duct from the bearing housing.
   - (m) Rotate adapter (501/10) to large OD up position and remove puller (inner assembly) (501/9).

- (2) Remove seal assembly from housing.
   - (a) Remove four screws (502/5) securing seal assembly (502/1) to housing assembly (502/3). See Figure 502.
   - (b) Using four jackscrews (502/4) installed in housing (502/3) remove seal assembly (502/1) from housing and place on bench large OD up.
   - (c) Locate nozzle (502/8) inside seal assembly (502/1) and remove bolts (502/9) and key washers (502/10) securing nozzle. Remove nozzle and discard key washers.
   - (d) Remove gasket (502/2) from housing (502/3).
   - (e) Rotate adapter (502/7) and housing (502/3) to large OD up position.

DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-01

Task 72-41-00-990-004:

1. General Inspection Requirements - Diffuser And Combustor

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check-00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check-00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check-01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check-02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−41−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−41−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

   (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

   (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

Task 72-41-00-990-001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508	0.512		
			(12.903)	(13.005)		
		Support	0.517	0.527	0.005	0.019
			(13.131)	(13.385)	(0.126)	(0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (-) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (-) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508	0.512		
			(12.903)	(13.005)		
		Support	0.517	0.527	0.005	0.020*
			(13.131)	(13.385)	(0.126)	(0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-05

Task 72-41-00-200-005:

1. Functional Check - Vacuum Check No. 3 Bearing Compartment

A. Equipment And Materials Required

Standard Tools:
PN AN929-8 Cap
PN MS24404-01 Plugs (Two Required)

Special Tools:
PWA 85482 Fixture, Vacuum Check

B. Procedure

Subtask 72-41-00-720-052:

(1) Install PWA 85482 Fixture into diffuser combustor. See Figure 801.
  (a) Prior to installation of fixture, inspect spacer micro finish faces for damage. Repair as required.
  (b) Align boltholes and install fixture, small end first, into rear end of diffuser case, and seal on rear flange of No. 3 bearing housing. Secure fixture with ten detail cap screws (801/3) and washers (801/4).
  (c) Align boltholes and install front cover (801/6) to fixture and secure with four bolts (801/5).

(2) Install AN929-8 Cap (801/1) to No. 3 bearing pressure tube at 10 o'clock position. Tighten cap.

(3) Install two MS24404-01 Plugs (801/2) to No. 3 bearing breather tube at one o'clock position and No. 3 bearing scavenge tube at 6:30 o'clock position. Tighten plugs.

(4) Attach vacuum hose and pressure sense line from CTE vacuum cart to cover. Vacuum check No. 3 bearing compartment with the vacuum cart pressure set at PAMB minus 10 psi (69 kPa), or PAMB minus 20 inches (508 mm) HG. At sea level this is 5.0 psia (34.5 kPa absolute). Airflow must not exceed eight lb. (3.63 kg) per hour.

(5) Shut off vacuum and disconnect lines from fixture. Remove all tooling from diffuser case. Install protective closures on tubes.

DIFFUSER AND COMBUSTOR - INSPECTION/CHECK-06

Task 72-41-00-990-006:

1. Visual Inspection - Diffuser And Combustion

   A. For inspection requirements applicable to installed (accessible) parts of the diffuser and combustion areas see 72-00-41, Inspection/Check-08 (Task 72-00-41-210-008).

   B. Visually inspect the diffuser and combustion areas for obvious surface defects and/or deformations which will preclude proper functioning of any of the parts. If defects are noted on any of the parts see the individual part section for damage limits.

Task 72-41-00-400-001:

1. Assemble The Diffuser And Combustor

A. Prerequisites

(1) See Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble No. 3 bearing duct and housing. See Assembly-02 Task 72-41-00-400-002-001 or Assembly-04 Task 72-41-00-400-002-002.

B. Equipment And Materials Necessary

Standard Tools:

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

CTE 5070	Cart, Airflow (Optional To PWA 6070)
CTE 6070	Cart, Airflow
PWA 24524	Tap
PWA 25039	Stand
PWA 25450	Aligning Pin (Two Necessary)
PWA 27641	Tap
PWA 27918	Sling (Optional To PWA 80555)
PWA 28657	Sling

C. Procedure
See Figure 1001.

Subtask 72-41-00-430-051:

(1) Install diffuser case in PWA 25039 Build Stand.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapter with PWA 85751 Brackets.

(a) Install two PWA 85751 Handling Brackets (1001/4) to diffuser case.

1 Using hoist, position longer front flange of brackets to rear of front flange of diffuser case at 3 and 9 o'clock locations, locating four pins in front flange of bracket into four boltholes in diffuser case front flange. Position shorter rear flange of bracket to front of diffuser case rear flange and secure with detail nuts and bolts.

2 Position double spool bracket in rear most two holes as marked on bracket.

R
R

WARNING: USE TWO OPERATORS WHEN INSTALLING OR TRUNNIONING CASE IN STAND. WHEN BALL LOCK PIN IS REMOVED, CASE MAY TRUNNION BY ITSELF, AND POSSIBLY CAUSE INJURY.

(b) Using hoist (1001/1) PWA 28657 Sling (1001/2) and two PWA 76154 Adapters (1001/3) trunnion and install diffuser case into PWA 25039 Stand (1001/5). Secure with ball lock pin.

(c) Remove hoist PWA 28657 Sling and two PWA 76154 Adapters.

(d) Facing rear of diffuser case and using tape mark rear flange in line with first hole to left of dowel pin.

(e) Facing front of diffuser case mark flange at offset hole. These marks will indicate bottom center line and 6 o'clock position of diffuser case.

Subtask 72−41−00−430−052:

(2) Install No. 3 bearing (breather) tube assembly (1002/5). See Figure 1002.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the No. 3 bearing (breather) tube assembly. Blow shop air through the tube assembly to assure absence of foreign material.

CAUTION: BE SURE THAT THE SEAL RINGS YOU USE HAVE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72−127 and SB PW4ENG 72−648.

(b) Install seal rings.

1 Install seal rings in the grooves at the center of the tube.

2 Install seal rings at each end of the tube.

a (Post PW4ENG 72-127 and Pre SB PW4ENG 72-648) The two-piece seal ring (1002/6) that is at the end of the tube that does not have a flange has special assembly instructions. Assemble it with the inner ring joint 180° ± 20° from the outer ring joint.

b (Post SB PW4ENG 72-648) Install the one-piece seal ring (1002/6) at the end of the tube that does not have a flange.

c Install seal rings at the flanged end of the tube.

(c) Install a gasket with a small quantity of Beeswax P05-395 or Paraffin Wax Blend P05-396 on the end of the tube.

(d) Install the tube assembly in the diffuser case at 11 o'clock (viewed from the front).

(3) Install No. 3 bearing (scavenge) tube assembly (1002/3). See Figure 1002.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the No. 3 bearing (scavenge) tube assembly. Blow shop air through the tube assembly to assure absence of foreign material.

CAUTION: BE SURE THAT THE SEAL RINGS YOU USE HAVE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-127 and SB PW4ENG 72-648.

(b) Install seal rings.

1 Install seal rings in the grooves at the center of the tube.

2 Install seal rings at each end of the tube.

a (Post PW4ENG 72−127 and Pre SB PW4ENG 72−648) The two−piece seal ring (1002/6) that is at the end of the tube that does not have a flange has special assembly instructions. Assemble it with the inner ring joint 180° ± 20° from the outer ring joint.

b (Post SB PW4ENG 72−648) Install the one−piece seal ring (1002/6) at the end of the tube that does not have a flange.

c Install seal rings at the flanged end of the tube.

(c) Install a gasket with a small quantity of Beeswax P05−395 or Paraffin Wax Blend P05−396 on the end of the tube.

(d) Install the tube assembly in the diffuser case at 5:30 o'clock (viewed from the front).

(4) Install turbine blade cooling tubes (1002/1) and (1002/4). See Figure 1002.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from two turbine blade cooling tubes. Blow shop air through tubes to assure absence of foreign material.

(b) Install a seal ring in the groove at the end of each tube.

(c) Install a seal ring in the grooves at each end of two seal ring transfer tubes.

(d) Install the transfer tubes in the cooling tubes. Be sure you engage the tabs on the transfer tubes with the slots on the cooling tubes.

(e) Install the assemblies through the struts of the case at 6:30 and 9:30 o'clock (as viewed from the front).

(5) (Pre SB PW4ENG 72-567) Install a diffuser seal air vent tube assembly (1002/2). See Figure 1002 (Sheet 1).

NOTE: Attach a temporary safety wire around the air vent tube so that the tube will not fall back into the diffuser case and cause unnecessary engine disassembly at a later engine assembly procedure.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from diffuser seal air vent tube assembly. Blow shop air through tube to assure absence of foreign material.

(b) Install a seal ring in the groove at the end of the tube assembly.

(c) Install the tube assembly through the strut of the case at 8:30 o'clock (as viewed from the front).

(6) (Post SB PW4ENG 72-567) Install a diffuser seal air vent tube assembly (1002/2). See Figure 1002 (Sheet 2).

NOTE: Attach a temporary safety wire around the air vent tube so that the tube will not fall back into the diffuser case and cause unnecessary engine disassembly at a later engine assembly procedure.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from diffuser seal air vent tube assembly. Blow shop air through tube to assure absence of foreign material.

(b) Install the seal rings in the grooves at the end of the two tube assemblies.

(c) Install the tube assemblies through the case struts at the 1:00 and 8:30 o'clock positions (as viewed from the front).

Subtask 72−41−00−430−053:

(7) Install No. 3 bearing (compartment) cooling tube.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from No. 3 bearing (compartment) cooling tube (1003/9) and blow shop air through tube to assure absence of foreign material. See Figure 1003.

(b) Install large seal ring (1003/8) in ring groove on tube (1003/9).

(c) Install small seal ring (1003/7) in rear groove on tube (1003/9).

(d) Install tube (1003/9) through case strut at 7:30 o'clock position (as viewed from the front).

(8) Install No. 3 bearing and airframe (oil vent and turbine cooling) manifold assemblies.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from No. 3 bearing and airframe (oil vent and turbine cooling air duct sensing outer) manifold assemblies (1003/6) and blow shop air through manifolds to assure absence of foreign material.

(b) Install seal rings (1003/5) in grooves on both manifold assemblies.

(c) Install manifold assemblies (1003/6) through case struts at 12:30 and 4 o'clock positions (as viewed from the front).

(9) Install No. 3 bearing (oil) pressure tube assembly.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from No. 3 bearing (oil) pressure tube assembly (1003/10) and blow shop air through tube assembly to assure absence of foreign material.

(b) Install seal ring (1003/1) in center groove on tube assembly.

(c) Install seal ring (1003/3) at end groove on tube assembly.

(d) Install large seal ring (1003/2) in large ring groove on tube.

(e) Install gasket (1003/4) with small amount of wax onto tube (1003/10).

(f) Install tube assembly through case strut at 2 o'clock position (as viewed from the front).

Subtask 72−41−00−430−054:

(10) Install airsealing ring assembly and transfer tubes. See Figure 1004.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Install diffuser airsealing ring assembly (1004/10) carefully aligning previously installed tubes. Insure that seal rings on tubes are properly engaged.

NOTE: Use two assemblers if necessary.

(b) Secure ring assembly to diffuser case with bolts (1004/1) lubricated with Engine Oil P03−001, and nuts (1004/11).

(c) Seat airsealing ring by gradually tightening bolts and nuts using 180 degree opposite pattern, until ring is fully seated against diffuser case flange.

(d) Torque nuts (1004/11) to 85 − 95 lb−in. (9.604 − 10.734 N.m) loosen and retorque to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(e) Install seal ring (1004/4) in groove on seal ring transfer (No. 3 bearing cooling front) tube (1004/6).

(f) Facing rear of diffuser case, locate tube protruding through airsealing ring at 4:30 o'clock position. Ensure that seal ring is present in ring groove on tube.

(g) Carefully install transfer tube (1004/6) over tube at 4:30 o'clock position, with tabs toward airsealing ring. Engage tabs with slots in airsealing ring. Ensure transfer tube is fully seated in airsealing ring.

(h) Install seal ring (1004/7) in groove on seal ring transfer (No. 3 bearing cooling rear) tube (1004/3).

(i) Carefully install transfer tube (1004/3) over tube at 4:30 o'clock position, engaging tabs in slots of previously installed transfer tube. Ensure transfer tubes are fully seated.

(j) Install seal ring (1004/5) in groove on two No. 3 bearing packing transfer (breather and scavenge) tubes (1004/2).

(k) Carefully install transfer tubes (1004/2) over tubes at 1 and 6:30 o'clock positions, with tabs toward airsealing ring. Engage tabs with slots in airsealing ring. Insure transfer tubes are fully seated in airsealing ring.

(l) Install seal ring (1004/8) in groove on packing transfer (oil pressure) tube (1004/9).

(m) Carefully install transfer tube (1004/9) over tube at 10 o'clock position with tabs toward airsealing ring. Engage tabs with slots in airsealing ring. Ensure transfer tube is fully seated in airsealing ring.

Subtask 72−41−00−430−055:

(11) Install turbine cooling duct sensing tube and oil vent tube.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from turbine cooling duct sensing (inner airframe) tube assembly (1005/1) and blow shop air through tube assembly to assure absence of foreign material. See Figure 1005.

(b) Install seal ring (1005/2) in groove on OD of tube nut (1005/10).

(c) Facing rear of diffuser case install tube assembly (1005/1) to previously installed cooling manifold at 11:30 o'clock position in airsealing ring. Rear end of tube assembly should pass through diffuser case flange. Handtighten tube nut (1005/10).

(d) Remove all protective closures from No. 3 bearing oil vent (inner) tube assembly (1005/3) and blow shop air through tube assembly to assure absence of foreign material.

(e) Install seal ring (1005/4) to groove on OD of tube nut (1005/9).

(f) Facing rear of diffuser case install tube assembly (1005/3) to previously installed cooling manifold at 8 o'clock position in airsealing ring. Do not tighten tube nut at this time.

(g) Locate two countersunk holes in diffuser case flange at approximately 7 o'clock position and secure tube assembly (1005/3) at two places with clamps (1005/5), brackets (1005/6), screws (1005/7) lubricated with Engine Oil P03−001, and nuts (1005/8).

(h) Torque both tube nuts to 200 − 225 lb−in. (22.597 − 25.422 N.m). Loosen and retorque to 200 − 225 lb−in. (22.597 − 25.422 N.m). Install the Lockwire P05−289 to safety the tube nuts.

NOTE: Hold connector on mating tube with PWA 87006 Wrench while torquing with PWA 103081 Torque Adapter.

(i) Torque screws, securing clamps at two locations to 36 − 40 lb−in. (4.067 − 4.519 N.m).

(12) Install No. 3 bearing cooling duct in diffuser case. See Figure 1006.

(a) Rotate diffuser case, rear end up, on PWA 85751 Brackets and lock in position.

(b) Looking down into the rear of diffuser case, install two PWA 25450 Aligning Pins (1006/4) 180 degrees apart to inner flange of case.

(c) Install three eye bolts, equally spaced, in the outer flange of the No. 3 bearing front cooling duct assembly and housing.

(d) With a three cable sling, lift and lower the No. 3 bearing front cooling duct assembly and housing into the diffuser case.

(e) Install No. 3 bearing front cooling duct assembly and housing (1006/5) to flange in diffuser case, carefully aligning tubes and seal rings previously installed. Remove the sling and eye bolts.

(f) Align four countersunk holes in housing flange with four smaller holes in case inner flange. Secure with four screws (1006/3) lubricated with Engine Oil P03-001. Do not tighten screws.

NOTE: Assure that dowel pin in assembly, engages dowel pin hole in previously installed tube at approximately 1 o'clock position.

(g) Ensure all tubes are properly aligned and seal rings are still in place.

(h) Install eight work bolts (1006/1) and washers (1006/2), one to each side of last four installed screws (1006/3).

(i) Carefully tighten work bolts (1006/1) in a 180 degree opposite pattern until assembly is fully seated. Torque work bolts to 290 lb-in. (32.766 N.m) maximum.

(j) Remove two alignment pins (1006/4).

(k) Run down four screws (1006/3) until bottomed, then back off screws one full turn. Torque screws 22 - 95 lb-in. (2.486 - 10.734 N.m).

(l) Remove eight work bolts (1006/1) and washers (1006/2).

(m) Rotate diffuser case to the horizontal position and lock in place.

Subtask 72-41-00-430-057:

CAUTION: BE SURE THAT THE HEAT SHIELDS YOU USE WITH THE NO. 3 BEARING (BREATHER) TUBE ASSEMBLY HAVE THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-127.

(13) Install the No. 3 bearing (breather) tube (1007/1), (oil) pressure tube (1007/3), and (scavenge) tube (1007/4). Also install the heat shields for these tubes and the (compartment) cooling tube (1007/2). See Figure 1007.

(a) Facing front of diffuser case, locate three large bosses (at 2:00, 5:30, and 11 o'clock) on airsealing ring. Attach the tubes (breather, pressure, and scavenge) at these locations using bolts, lubricated with Engine Oil P03-001.

(b) Torque the bolts to 125 - 170 lb-in. (14.123 - 19.207 N.m). Without loosening, continue to tighten to same limits until torque is maintained. Lockwire P05-289 to safety the bolts.

(c) Install the heat shield halves over the oil pressure tube at 2:00 o'clock and the oil breather tube at 11 o'clock as follows:

1 Install the heat shield flange halves into the boss on the airsealing ring. Put the largest flat side of the heat shield flange against the bolts.

2 Install the inner heat shield halves around the tube assembly.

3 Install the outer heat shield halves over the inner heat shield halves. Use PWA 101455 Installation Clamp to hold the heat shield in position around the tube for the lockwire installation.

4 (Post SB PW4ENG 72-623) Attach the heat shield assembly with Lockwire P05-365 at both ends and middle. Wrap the lockwire three full turns around the heat shield and make safe with three full twists. The twist must be outward away from the rotor.

5 Remove the installation clamp (PWA 101455).

(d) Install the heat shield halves over the oil scavenge tube at 5:30 o'clock and the compartment cooling tube at 7:30 o'clock as follows:

1 Install the heat shield flange halves into the boss on the airsealing ring for the oil scavenge tube. Put the largest flat side of the heat shield flange against the bolts.

2 Install the inner heat shield halves around the tube assembly.

3 Install the outer heat shield halves over the inner heat shield halves. Use PWA 101456 Installation Clamp to hold the heat shield in position around the tube for the lockwire installation.

4 (Post SB PW4ENG 72-623) Attach the heat shield assembly with the Lockwire P05-365 at both ends and middle. Wrap the lockwire three full turns around the heat shield and make safe with three full twists. The twist must be outward away from the rotor.

5 Remove the installation clamp (PWA 101456).

Subtask 72-41-00-430-058-A:

CAUTION: THE INSTALLATION OF PN 50J685 COMPRESSOR STATOR EXIT ASSEMBLY IS OPTIONAL WITH PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD. PN 51J285-01, PN 51J385-01 OR PN 51J685-01 COMPRESSOR STATOR EXIT ASSEMBLY CANNOT BE INSTALLED WITH PN 50H879 SUPPORT AND PN 50H883 HEAT SHIELD.

(14) Install Stage 15 HPC stator.

(a) (Pre SB PW4ENG 72-572) Place Stage 15 HPC airsealing ring assembly (1008/1) on clean paper on bench with large ID facing up. See Figure 1008 (Sheet 1).

(b) Locate two larger flange holes with five smaller holes in between. Mark a reference line on flange in line with two large holes using marking crayon.

(c) Chill airsealing ring (1008/1) assembly for ten minutes.

(d) Facing front of diffuser case, locate two large holes with five smaller holes in between on case flange. Mark a reference line in line with two large holes using marking crayon.

(e) Place compressor exit stator assembly (1008/2) on clean paper on bench with slotted flange down.

(f) Locate two larger flange holes with five slots in between. Mark a reference line in line with two large holes using marking crayon.

(g) Chill stator assembly (1008/2) for ten minutes.

(h) Install two PWA 85046 Align Pins 180 degrees apart in diffuser case inner flange. Allow pins to pilot into inner flange holes.

(i) Install chilled airsealing ring assembly (1008/1) in diffuser case, aligning marks at two large flange holes. If necessary tap to seat.

(j) Install chilled compressor exit stator assembly (1008/2) in case over gasket and airsealing ring, aligning crayon marks at two large flange holes. If necessary tap to seat.

(k) Remove two PWA 85046 Align Pins.

(l) Remove protective closures from ten Stage 15 HPC airsealing ring nozzles (1008/4) and blow shop air through nozzles to assure absence of foreign material.

(m) Install spacer plates (1008/5) to 34 slots on stator assembly (1008/2).

(n) Install ten nozzle assemblies (1008/4) to large holes in stator flange, through to bosses on diffuser case. Nozzle openings to point in a counterclockwise direction.

(o) Secure with bolts (1008/6), lubricated with Engine Oil P03-001, and nuts (1008/7) fingertight. Install 14 lubricated bolts (1008/6) washers (1008/3) and nuts (1008/7) to remaining holes.

(p) Torque bolts to 85 - 95 lb-in (9.604 - 10.734 N.m) loosen and retorque to 85 - 95 lb-in. (9.604 - 10.734 N.m).

Subtask 72-41-00-430-058-B:

(15) (Post SB PW4ENG 72-572) Install the HPC exit brush seal support assembly (called brush seal support) (1008/1) and the compressor exit stator assembly (called stator) (1008/2). See Figure 1008 (Sheet 2).

(a) Put the brush seal support on clean paper on a bench with the OD surface down.

(b) Find the two larger flange holes with the six smaller holes in between. Mark a reference line on the front of the flange in line with the two large holes with a marking crayon.

NOTE: The threaded hole is at 12:30 o'clock and one of the two large holes is at 11:00 o'clock.

(c) Chill the brush seal support for approximately ten minutes.

(d) Put the stator on clean paper on the bench with the slotted flange down.

(e) Find the two larger flange holes with the five slots in between. Mark a reference line in line with the two large holes with a marking crayon.

(f) Chill the stator for approximately ten minutes.

(g) Install PWA 87153 Heater on the inner front flange of the diffuser case as follows:

1 The heater thermocouple must touch the flange.

2 Attach the PWA 29754 Heater Control to the receptacle and the thermocouple.

3 Start the heater element to increase the temperature of the diffuser case flange to 350° − 375°F (176.7° − 190.6°C).

4 Remove the heater and heater control.

(h) Look at the front of the diffuser case. Find the two large holes with the five smaller holes in between on the inner front flange. Mark a reference line in line with the two large holes with a marking crayon.

(i) Install PWA 87154 Guide Pin on the brush seal support as follows:

1 Put the guide pin called 12 o'clock into the bolt hole at the 12 o'clock location.

NOTE: The 12 o'clock hole is adjacent to the threaded hole that is in between the two alignment marks.

2 Turn the knurled knob of the threaded rod to attach the guide pin to the brush seal support assembly.

(j) With marks aligned, install the chilled brush seal support in the diffuser case. If necessary, tap to seat.

(k) Remove the guide pin from the brush seal support.

(l) Install the PWA 101863 Alignment Pin on the compressor exit stator assembly as follows:

1 Put the alignment pin specified as 12 o'clock into the bolt slot adjacent to the jack screw hole near the 12 o'clock location.

2 Turn the knurled knob of the threaded rod to attach the alignment pin to the compressor exit stator assembly.

(m) With marks aligned, install the chilled stator in the case over the brush seal support. If necessary, tap to seat.

(n) Remove the alignment pin from the compressor exit stator assembly.

Subtask 72-41-00-430-059:

(16) (Pre SB PW4ENG 72-567) Install No. 3 bearing manifold and (oil) pressure tube gaskets and lock plates. See Figure 1009 (Sheet 1).

(a) Facing front of diffuser case, locate pad at 2 o'clock with manifold protruding through the outside of diffuser case.

(b) Install gasket (1009/10) to case pad.

(c) Install sleeve (1009/14) with small ID over seal ring.

(d) Install plate lock (1009/11) with slot upward.

(e) Install shield (1009/12) with open end outward, aligning bolt holes.

(f) Secure with bolts (1009/13) lubricated with Engine Oil P03-001. Tighten bolts fingertight.

(g) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Without loosening continue to tighten to same limits until torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(h) Locate pad at 4 o'clock position with manifold protruding through the outside of diffuser case.

(i) Install gasket (1009/9) to case pad.

(j) Install sleeve (1009/7) with small ID over seal ring.

(k) Install plate lock (1009/8) with slot upward.

(l) (Pre SB PW4ENG 72-570) No No. 3 bearing weep tube heat shield assembly installed.

1 Attach with bolts (1009/6) and (1009/15), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

2 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

3 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(m) (Post SB PW4ENG 72-570) No. 3 bearing weep tube heat shield assembly installed.

1 Install the heat shield (1009/16) over the plate lock (1009/8).

2 Attach with bolts (1009/17) and (1009/18), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

3 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

4 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(n) Locate pad at 1 o'clock position with tube protruding through the outside of diffuser case.

(o) Install gasket (1009/5) to case pad.

(p) Install sleeve (1009/4) with small ID over seal ring.

(q) Install plate lock (1009/3) with slot upward.

(r) Secure with bolts (1009/2) lubricated with Engine Oil P03-001. Tighten bolts fingertight.

(s) Torque bolts 65 - 85 lb-in. (7.344 - 9.604 N.m). Without loosening continue to tighten to same limits until torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(t) Install cap assembly (1009/1). Torque to 270 − 300 lb−in. (30.506 − 33.895 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the cap assembly.

(17) (Post SB PW4ENG 72−567) Install No. 3 bearing manifold and (oil) pressure tube gaskets and lock plates. See Figure 1009 (Sheet 2).

(a) Find the pad at 2 o'clock where a manifold comes out of the side of diffuser case.

(b) Install the gasket (1009/28) to the case pad.

(c) Install the sleeve (1009/32) with small ID over the seal ring.

(d) Install the plate lock (1009/29) with slot upward.

(e) Install the shield (1009/30) with open end outward, aligning bolt holes.

(f) Attach with bolts (1009/31) lubricated with Engine Oil P03−001. Tighten bolts fingertight.

(g) Torque the bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(18) (Post SB PW4ENG 72−567) Install the No. 3 bearing and airframe manifold assembly lock plates and gaskets. See Figure 1009 (Sheet 2).

(a) Find the pad at the 4 o'clock position with the manifold that extends through the outside of the diffuser case.

(b) Install the gasket (1009/27) to the case pad.

(c) Install the sleeve (1009/25) with small ID over the seal ring.

(d) Install the plate lock (1009/26) with slot upward.

(e) Attach with bolts (1009/24) lubricated with Engine Oil P03-001. Tighten bolts fingertight.

(f) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(g) Find the pad at the 1 o'clock position with the tube that extends through the outside of the diffuser case.

(h) Install the gasket (1009/23) to the case pad.

(i) Install the sleeve (1009/22) with small ID over the seal ring.

(j) Install the plate lock (1009/21) with slot upward.

(k) (Pre SB PW4ENG 72-570) No No. 3 bearing weep tube heat shield assembly installed.

1 Attach with bolts (1009/6) and (1009/22), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

2 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

3 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(l) (Post SB PW4ENG 72-570) No. 3 bearing weep tube heat shield assembly installed.

1 Install the heat shield (1009/41) over the plate lock (1009/26).

2 Attach with bolts (1009/42) and (1009/43), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

3 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

4 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(m) Install the cap assembly (1009/19). Torque to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the cap assembly.

(19) (Post PW4ENG 72-567) Install the cover (1009/34) and seal (1009/37). See Figure 1009 (Sheet 2).

(a) Put a gasket (1009/33) on the six hole pad at 10:30 o'clock.

(b) Install the cover (1009/34) on the gasket. Install the bracket (1009/39) on the two forward holes of the cover. Install six bolts (1009/17), threads lubricated with Engine Oil P03-001, in the cover. Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(c) Install the seal ring (1009/36) on the seal (1009/37).

(d) Install the seal (1009/37) on the rod of the cover (1009/34) in the ID of the diffuser case. Install the nut (1009/20), threads lubricated with
R Lubricant P06-023 0r Antiseize Paste P06-054, on
R the rod. Torque the nut to 190 - 215 lb-in.
R (21.467 - 24.292 N.m).

Subtask 72-41-00-430-060-A:

CAUTION: BE SURE THAT YOU USE PARTS WITH THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-127.

(20) (Pre SB PW4ENG 72-567) Install No. 3 bearing (breather) tube mating parts (1010/1). The pad is at 11 o'clock on the diffuser case (viewed from the front). See Figure 1010.

(a) Install a packing holder.

(b) If applicable, install a gasket and sleeve in the packing holder, with the small ID of the sleeve over the seal ring of the tube.

(c) Install a retaining plate.

(d) Install bolts, lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(e) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(f) Install a tube nut over the end of the tube. Install thrust wire, lubricated with Engine Oil P03-001, in the tube nut.

(21) (Pre SB PW4ENG 72-567) Install No. 3 bearing (scavenge) tube mating parts (1010/3). The pad is at 6 o'clock on the diffuser case (viewed from the front). See Figure 1010.

(a) Install a packing holder.

(b) Install a gasket and sleeve in the packing holder, with the small ID of the sleeve over the seal ring of the tube.

(c) Install a retaining plate.

(d) Install bolts, lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(e) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(f) Install a tube nut over the end of the tube. Install thrust wire, lubricated with Engine Oil P03-001, in the tube nut.

(22) (Pre SB PW4ENG 72-567) Install No. 3 bearing (compartment) cooling tube mating parts (1010/2).

CAUTION: INSTALL THE LOCKS WITH THE SLOT GROOVE OUTWARD AND THE PIN (IF EQUIPPED) INWARD. BE SURE THE LOCKS ENGAGE THE GROOVE OF THE TUBE.

(a) Install the locks in the groove at the end of the (compartment) cooling tube.

(b) (Reference 1990) Hold the locks outward against the internal face of the groove. Do a measurement of the distance from the end of the tube to the surface of the locks. The end of the tube must be 0.000 - 0.020 inch (0.000 - 0.508 mm) above the locks. If the measurement is not within this limit, install the locks again.

(c) Install a gasket around the OD of the locks.

(d) Install a gasket over locks with the raised lip of the gasket against the tube.

(e) Install the elbow. Attach the elbow with ten bolts, lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(f) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(g) Install a washer on the flat threaded end of the adapter.

(h) Lubricate the flat threaded end of the adapter with Engine Oil P03-001. Install the adapter in the elbow.

(i) Torque the adapter to 450 - 550 lb-in. (50.843 - 62.142 N.m).

Subtask 72-41-00-430-060-B:

(23) (Post SB PW4ENG 72-567) Install the No. 3 bearing (breather) tube lock plate. See Figure 1011.

CAUTION: BE SURE THAT YOU USE PARTS WITH THE CORRECT PART NUMBERS. INTERCHANGEABILITY IS AFFECTED. REFER TO SB PW4ENG 72-127.

(a) Find the pad at 11 o'clock. It has a tube that comes through the boss.

(b) Install a gasket (1011/6) on the pad.

(c) Install a sleeve (1011/5) in the gasket.

(d) Install a plate lock (1011/4) on the sleeve, slot to the rear.

(e) Install three bolts (1011/3), threads lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(f) Install a tube nut (1011/2) on the tube. Install thrust wire (1011/1), lubricated with Engine Oil P03-001.

(g) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(24) (Post SB PW4ENG 72-567) Install the plate for the No. 3 bearing (scavenge) tube, which is at 5:30 o'clock. See Figure 1011.

(a) Install a gasket (1011/7) on the pad.

(b) Install a sleeve(1011/8) in the gasket.

R
R

(c) Install a plate (1011/9) on the sleeve.

(d) Install three bolts (1011/12), threads lubricated with Engine Oil P03-001, in the plate. Tighten the bolts with your fingers.

(e) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limit until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(f) Install a tube nut (1011/10). Install thrust wire (1011/11), lubricated with Engine Oil P03-001, in the tube nut.

(25) (Post SB PW4ENG 72-567) Install the No. 3 bearing cooling tube lock and elbow, which is at 7:30 o'clock. See Figure 1011.

CAUTION: INSTALL LOCK PLATES (1011/16) WITH SLOT GROOVE OUTWARD AND PIN INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 1011.

(a) At the boss at 7:30 o'clock, install the locks (1011/16) to flange lip of the internal tube and align the bolt holes.

(b) (Reference 1990) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 - 0.020 inch (0.000 - 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip correctly.

(c) Install the gasket (1011/17) around OD of locks.

(d) Install the gasket (1011/15) over the locks with the raised lip against the tube. Align bolt holes.

(e) Install the elbow (1011/14) and align the bolt holes.

(f) Attach the elbow with ten bolts (1011/13), threads lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(g) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(h) Install the washer (1011/18) to flat threaded end of the adapter (1011/19).

(i) Lubricate the flat threaded end of the adapter with Engine Oil P03-001, and install the adapter in the elbow.

(j) Torque the adapter to 450 - 550 lb-in. (50.843 - 62.142 N.m).

(26) (Pre SB PW4ENG 72-567) Remove protective closures from diffuser seal air vent (elbow) tube assembly. Blow shop air through the tube assembly to assure absence of foreign material. See Figure 1012.

(a) Facing front of diffuser case, locate boss at 1 o'clock position.

(b) Install gasket to tube assembly.

(c) Install tube assembly with gasket and bracket to case boss using bolts, threads lubricated with Engine Oil P03-001.

(d) Torque bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Without loosening continue to tighten to the same limits until torque is maintained. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

Subtask 72-41-00-720-051:

(27) Vacuum check the No. 3 bearing compartment. See Inspection/Check-05 Task 72-41-00-200-005.

Subtask 72-41-00-720-055:

(28) Airflow check No. 3 bearing oil nozzle. See Figure 1013.

NOTE: Airflow check is to ensure that passages are not obstructed or misassembled.

(a) Locate outside end of No. 3 bearing pressure tube assembly. Secure PWA 85565 Adapter to outside end of No. 3 bearing pressure tube diffuser and combustor.

(b) Secure air inlet hose from CTE 6070 Airflow Cart or CTE 5070 Airflow Cart to larger threaded hole of adapter.

(c) Secure pressure sensing line to smaller threaded hole.

(d) Airflow check nozzle at 10 psig (68.9 kPa). Airflow rate must be 40 - 50 lb/hr (18.14 - 22.68 kg/hr).

(e) After airflow rate limits have been met, remove adapter and airflow cart.

Subtask 72-41-00-430-061:

CAUTION: WHEN PN 50J488 OUTER COMBUSTION CHAMBER IS INSTALLED, PN 50K488 INNER COMBUSTION CHAMBER MUST ALSO BE INSTALLED.

(29) Install outer combustion chamber assembly.

(a) Install diffuser case to front end down position in PWA 86508 Build Stand or PWA 85044 Build Stand and secure. See Figure 1014.

(b) Remove two PWA 85751 Handling Brackets from diffuser case.

(c) Visually check interior of diffuser case for correct assemblies, absence of foreign material or damage and that all details are secure. Pay particular attention to mating surfaces of carbon seal.

(d) Locate 12 threaded bosses located around OD of diffuser case. Install PWA 85060 Alignment Pins to three equally spaced bosses in the case and retract the inner portion of the pins.

(e) Using PWA 27918 Sling or PWA 80555 Sling (1014/1) lift outer combustion chamber assembly (1014/2) and position over diffuser case. Align two igniter holes in combustion chamber with igniter bosses in diffuser case located at 4 o'clock position.

(f) Carefully lower combustion chamber into diffuser case while keeping igniter bosses aligned. Lower combustion chamber so that lugs on bottom of chamber are even with bosses on diffuser case. Push the inner portion of the pins in to align the combustion chamber mount lugs with the diffuser case at three places.

(g) Lubricate the threads and seating surface of the twelve doweled end retaining bolts (1014/3) with Lubricant P06−023 and wipe clean any lubricant from other bolt surfaces before you installation. Install nine lubricated bolts (1014/3) and washers (1014/4) through the outside of diffuser case to locate the combustion chamber mount lugs. Wipe clean any excess lubricant from the case and/or bolt surfaces.

(h) Remove one aligning pin at a time and install the three remaining bolts and washers.

(i) (Reference 402) Remove sling. Torque bolts (1014/3) 500 − 600 lb−in. (56.492 − 67.791 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

Subtask 72−41−00−430−062:

(30) Install the igniter plugs. See Figure 1015 and Figure 1016.

NOTE: Presently there are (3) three igniter plug guide configurations installed in the outer combustion chamber. (Pre SB PW4ENG 72−152) chambers have an extended sleeve (1015/7) and no shield. (Post SB PW4ENG 72−152) chambers have a short sleeve and a shield. (Post SB PW4ENG 72-601) Chambers have an extended, necked-out sleeve and a lock.

(a) There are two PWA Immersion Gages now in use to measure igniter plug immersion depth.

1 PWA 85626 Immersion Gage can only be used on combustion chambers with the extended sleeve (1015/7) and no shield (Pre SB PW4ENG 72-152). See Figure 1015 (Sheet 1).

2 PWA 75509 Immersion Gage can be used on each of the two combustion chamber configurations now in use (Post SB PW4ENG 72-152). See Figure 1015 (Sheets 2 and 3).

(b) To measure igniter plug immersion depth with PWA 85626 Immersion Gage, follow these instructions.

NOTE: This procedure pertains to the two igniter plug locations.

1 Install the key washer (1015/2) to the igniter plug boss (1015/3) with the tabs to the boss. Do not bend the tabs.

2 Install the boss and key washer to the igniter plug (1015/1) and tighten by hand.

3 Install the PWA 85626 Immersion Gage (1015/8), contoured surface first, against the inner surface of the outer combustion chamber (1015/6) at the igniter plug location. Adjust the gage by touching the axial cutout surface of the gage against the extended sleeve (1015/7) of the chamber, at the same time the contoured surface of the gage touches the second chamber liner. Hold the gage firmly in this position.

4 Install the igniter plug, key washer, and boss assembly into the diffuser case until the plug touches the bottom of the immersion gage pin.

5 Measure the distance between the igniter plug boss and the diffuser case boss with a feeler gauge and/or shim stock. This measurement is the necessary spacer thickness. Remove the gage.

6 Use a classified spacer (1015/4) or a combination of spacers to get the distance measurement in step 5 plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers for each plug. The total combined thickness of spacer(s) is not to exceed 0.300 inch (7.620 mm). See Figure 1015 and Figure 1016.

7 Remove the igniter plug, key washer, plug boss, and spacer(s) from the diffuser case.

8 Fully clean the igniter plug, igniter boss, and diffuser case threads with Petroleum Solvent P11-027.

9 Install the key washer to the plug boss with the tabs to the boss. Bend the tabs over to attach the key washer to the boss.

10 Lubricate the outer threads of the plug boss with Lubricant P06-023.

11 (Reference 400) Install the classified spacer(s) to the boss. Install the boss to the diffuser case. Torque the boss to 375 - 440 lb-in. (42.369 - 49.713 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the boss.

12 Apply Thread Lubricant P06-023 to the igniter plug threads.

13 (Reference 401) Install the igniter plug to the boss. Torque the plug to 300 - 360 lb-in. (33.895 - 40.675 N.m).

(c) Measure igniter plug immersion depth using PWA 75509 Immersion Gage

1 If necessary, clean threads of boss with the PWA 24524 Tap.

2 Install a new key washer to igniter boss with tabs toward boss.

3 Install boss and key washer to igniter plug fingertight.

4 (Reference 365 or 386) Measure Dimension A from plug tip to bottom face of boss. See Figure 1015 (Sheet 2, 3, 4 or 5). Record Dimension A.

5 Disassemble key washer and boss from igniter plug and place on bench.

6 Using a strong light, look in the igniter boss hole in the diffuser case and determine which igniter plug guide configuration (shielded or unshielded) is installed in the outer combustion chamber. See Figure 1015 (Sheet 2, 3, 4 or 5).

  a Using detail gage master place the master between the gage hook and the gage base. Set gage indicator level to zero.

  b Insert gage into the igniter boss hole in diffuser case until gage base is seated on face of case boss.

  c Rotate gage base to obtain an uninterrupted view of dial gage face.

  d Holding gage base, rotate probe until notch in probe disk is pointing to rear of engine.

  e Depress probe and slide gage towards rear of engine to seat gage hook against rear ID surface of outer combustion chamber.

  f Release probe and record dial gage reading. Add the gage reading to 2.200 inches (55.880 mm) if reading is a plus reading. Subtract the gage reading from 2.200 inches (55.880 mm) if reading is a minus reading. Result is Dimension B.

g (Pre SB PW4ENG 72-152) For engines incorporating combustion chambers with extended sleeve and no shield, add 0.025 inch (0.635 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

h Select a classified spacer or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacer(s) not to exceed 0.300 inch (7.620 mm). See Figure 1015 (Sheet 2).

i (Post SB PW4ENG 72-152 and Post SB PW4ENG 72-601) For engines incorporating combustion chambers with flush sleeve and a shield or a lock add 0.125 inch (3.175 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

j Select a classified spacer or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacers(s) not to exceed 0.300 inch (7.620 mm). See Figure 1015 (Sheet 3 or 4).

k For engines with Talon Low Emission combustion chambers there is a flush sleeve and a lock. Add 0.075 inch (1.905 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

l Select a classified spacer or combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers per plug. Total combined thickness of spacer(s) not to exceed 0.300 inch (7.620 mm). See Figure 1015 (Sheet 5).

7 If necessary, clean threads in diffuser case port using PWA 27641 Tap.

8 Fully clean the igniter plug, igniter boss and diffuser case threads with Petroleum Solvent P11-027.

9 Install key washer to igniter boss and bend tabs over to secure.

10 Lubricate OD threads of boss with Lubricant P06-023.

11 (Reference 400) Install previously selected classified spacer(s) to boss and install boss to diffuser case. Torque boss to 375 - 440 lb-in. (42.369 - 49.713 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to the boss.

12 Apply Thread Lubricant P06-023 to threads of igniter plug.

13 (Reference 401) Install igniter plug to boss. Torque plug to 300 - 360 lb-in. (33.895 - 40.675 N.m).

NOTE: Keep igniter plug boss from turning while torquing plug.

Subtask 72-41-00-430-063:

(31) Install fuel injectors and support assemblies. See Figure 1017.

(a) Using tape above each fuel injector boss, identify each boss beginning with first boss to right of bottom centerline as No. 12 and first boss to left of bottom centerline as No. 13. Continue numbering bosses in a clockwise direction to 24.

(b) Place 24 fuel injectors (1017/7) on bench and install gasket (1017/5) lubricated with Beeswax P05-395 or Paraffin Wax Blend P05-396, to each injector.

(c) Install fuel injectors at bosses marked No. 1, 2, 3 and 4 through diffuser case with nozzle pointing upward. Secure with bolts (1017/6) lubricated with Engine Oil P03-001, fingertight.

(d) At injector boss marked No. 5, install fuel injector and bracket (1017/8). Secure with bolts lubricated with Engine Oil P03-001, fingertight.

(e) At boss No. 6 install fuel injector and bracket (1017/10). Secure with lubricated bolts fingertight.

(f) At boss No. 7 install fuel injector and bracket (1017/11). Secure with lubricated bolts fingertight.

(g) At boss No. 8 install fuel injector and bracket (1017/12). Secure with lubricated bolts fingertight.

(h) Install nine fuel injectors at bosses No. 9 through 17 and secure with lubricated bolts fingertight.

(i) At boss No. 18 install fuel injector and bracket (1017/1). Secure with lubricated bolts fingertight.

(j) Install fuel injector at boss No. 19 and secure with lubricated bolts fingertight.

(k) At boss No. 20 install fuel injector and bracket (1017/2). Secure with lubricated bolts fingertight.

(l) At boss No. 21 install fuel injector and bracket (1017/3). Secure with bolts lubricated with Engine Oil P03-001.

(m) Install fuel injectors at bosses No. 22 and 23 and secure with lubricated bolts fingertight.

(n) At boss No. 24:

  1 Pre SB PW4ENG 72-2: Install a fuel injector and bracket (1017/4). Secure with bolts lubricated with Engine Oil P03-001.

  2 Post SB PW4ENG 72-2: Install a fuel injector and secure with bolts lubricated with Engine Oil P03-001.

(o) Ensure all fuel injectors (1017/7) are properly installed and torque bolts (1017/6) evenly around case 65 - 85 lb-in. (7.344 - 9.604 N.m). Without loosening continue to torque 65 - 85 lb-in. (7.344 - 9.604 N.m) until no loss of torque occurs.

(p) Lockwire two upper bolts together on fuel injectors at Locations No. 1, 3, 4, 6, 7, 9, 10, 12, 13, 15, 16, 18, 19, 21, 22 and 24.

NOTE: The lower bolt at the above locations will be lockwired to fuel manifold nuts in a later assembly operation.

(q) Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the three bolts together on fuel injectors at Locations No. 2, 5, 8, 11, 14, 17, 20 and 23.

NOTE: Do not remove tape used to indicate fuel injector location numbers at this time.

Subtask 72-41-00-430-064:

(32) Install diffuser case externals.

(33) Position diffuser case in PWA 86508 Build Stand or PWA 85044 Build Stand to align flange holes No. 37 through 43 with cut out in build stand. See Figure 1018.

Bracket Reference Number	Position On Diffuser Case	Bolt Torque lb-in. (N.m)	Service Bulleting Reference
3	2 o'clock	65 - 85 (7.344 - 9.604)	
4	3:30 o'clock	125 - 170 (14.123 - 14.207)	
5	4 o'clock	65 - 85 (7.344 - 9.604)	
6	5 o'clock	65 - 85 (7.344 - 9.604)	
7	7 o'clock	65 - 85	

Table 1018

(CONTINUED)

Bracket Reference Number	Position On Diffuser Case	Bolt Torque lb−in. (N.m)	Service Bulleting Reference
		(7.344 − 9.604)	
8	8:30 o'clock	65 − 85 (7.344 − 9.604)	
9	8:30 o'clock	65 − 85 (7.344 − 9.604)	

Table 1018 (Continued)

(a) Install the four bolts (1018/13), lubricated with Engine Oil P03−001, and washers (1018/12) to the pads at 10 and 11:30 o'clock positions. Torque the bolts to 125 − 170 lb−in. (14.123 − 19.207 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety all the bolts after the torque.

(b) Install the six borescope plugs (1018/18) or (1018/18A), lubricated with Lubricant P06−023, and gaskets (1018/17) at 1:30, 4:30, 5:30, 7:30, 9 and 11 o'clock positions. Torque the plugs to 40 − 50 lb−in. (4.519 − 5.649 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(c) Install the two adapters (1018/5), lubricated with Engine Oil P03−001, and gaskets (1018/16), to the bosses forward of the fuel injector bosses at 12:30 and 1:30 o'clock positions. Torque the adapters to 110 − 120 lb−in. (12.428 − 13.558 N.m).

(d) Install the two gaskets (1018/22) and the two covers (1018/23) to the pads at 2 and 7:30 o'clock positions forward of the fuel injector bosses. Attach the covers with six bolts (1018/21), lubricated with Engine Oil P03−001. Torque the bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(e) Install the gasket (1018/20) and the adapter (1018/19), lubricated with Engine Oil P03-001, to the cover at 2 o'clock position. Torque the adapter to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the gasket (1018/26) and the plug (1018/27), lubricated with Engine Oil P03-001, to the cover at 7:30 o'clock position. Torque the plug to 110 - 120 lb-in. (12.428 - 13.558 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the plug.

(f) (Post SB PW4ENG 73-163) Install the EEC thermocouple (TT3) probe (1018/25) as follows:

1 Install the gasket (1018/24) to the probe (1018/25).

2 Lubricate the probe threads with Engine Oil P03-001.

3 Install the probe and gasket to the boss at 2:30 o'clock position behind the fuel injector bosses.

4 (Reference 411) Remove lockwire between the body nut and coupling nut. Loosen the coupling nut from the body nut. Torque the body nut (to the case) to 95 - 100 lb-in. (10.734 - 11.299 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the body nut to the case.

5 Attach the PWA 87649 Angle Gage to the two bolt hole boss of the diffuser case on the right side (horizontal centerline) with hex head screws. Move the gage guide into position.

6 Turn the probe so the two larger studs are to the right as shown. Hold the probe in place.

7 Touch the side of the thermocouple probe with the guide and tighten the hand knob to hold the guide assembly in position. This will correctly position the thermocouple probe for the electrical harness alignment connection.

R
R

8 (Reference 410) Torque the coupling nut to 95 - 100 lb-in. (10.734 - 11.298 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the coupling nut to the body nut.

(g) (Post SB PW4ENG 72-567) (Pre SB PW4ENG 72-699) Install a two hole cover (1018/29) with gasket (1018/28) to the diffuser case at the 9:15 o'clock position with two bolts (1018/30), threads lubricated with Engine Oil P03-001. Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

Subtask 72-41-00-430-065:

(34) (Reference 407) Install fuel injector supply manifold assemblies. See Figure 1019.

CAUTION: FOR ALL PACKING LUBRICANTS, APPLY ONLY A THIN COAT OR THE FUEL SYSTEM CAN BECOME BLOCKED.

(a) Install the packings (1019/3), lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the packing groove on each fuel injector.

(b) Remove closures from manifold assembly (1019/2) and blow shop air through assembly to assure absence of foreign material.

(c) Using Engine Oil P03-001, lubricate threads of tube nuts (1019/1) on manifold assembly (1019/2) at three places.

(d) Install manifold assembly (1019/2) to fuel injectors No. 10, 11 and 12. Secure tube nuts (1019/1) fingertight at three places.

(e) Remove closures from remaining seven manifold assemblies (1019/5) and blow shop air through assembly to assure absence of foreign material.

(f) Using Engine Oil P03-001, lubricate threads of tube nuts on manifold assemblies.

(g) Install manifold assemblies (1019/4) to remaining fuel injectors. Secure tube nuts fingertight.

NOTE: Tube nuts will be torqued after fuel distribution system leak test has been accomplished. Refer to Assembly-03 Task 72-41-00-400-003.

D. Postrequisites

(1) For diffuser combustor assemblies having No. 3 bearing outer race installed see 72-00-41, Installation-01 (Task 72-00-41-420-001) for installation of diffuser combustor onto high pressure compressor. For diffuser combustor assemblies without No. 3 bearing outer race installed see 72-00-41, Installation-14 (Task 72-00-41-420-014) for installation of diffuser combustor onto high pressure compressor.

DIFFUSER AND COMBUSTOR - ASSEMBLY-01

Task 72-41-00-400-001-A:

1. Assemble The Diffuser And Combustor

A. Prerequisites

(1) See Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble No. 3 bearing duct and housing. See Assembly-02 Task 72-41-00-400-002-001 or Assembly-04 Task 72-41-00-400-002-002.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Flameless Torch Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the special tools list, and the optional flame torch.

Bergen Mechanical Crimper (Optional) Model M303, M305 or M307

Special Tools:

CTE 5070	Cart, Airflow (Optional To PWA 6070)
CTE 6070	Cart, Airflow
PWA 24524	Tap
PWA 25039	Stand
PWA 25450	Aligning Pin (Two Necessary)
PWA 27641	Tap
PWA 27918	Sling (Optional To PWA 80555)
PWA 28657	Sling
PWA 29754	Control, Heater
PWA 75509	Gage, Immersion
PWA 76154	Adapter (Two Necessary)
PWA 80555	Sling
PWA 85044	Stand (Optional to PWA 86508)
PWA 85060	Pin (Three Necessary)

Special Tools:

(CONTINUED)

PWA 85565	Adapter
PWA 85751	Bracket (Two Necessary)
PWA 85983	Adapter, Stabilizer (Two Necessary, Twin Overhead Rail System Only)
PWA 86508	Build Stand
PWA 87006	Adapter, Wrench
PWA 87153	Heater, Electrical
PWA 87154	Pin, Guide
PWA 87649	Gage, Angle
PWA 101455	Clamp, Installation
PWA 101456	Clamp, Installation
PWA 101863	Pin, Alignment
PWA 103081	Adapter, Torque

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-289	Lockwire (AS3214-02)
P05-291	Cable, Safety (Optional)
P05-292	Ferrule, Safety Cable (Optional)
P05-395	Beeswax
P05-396	Paraffin Wax Blend
P06-023	Lubricant, Silvergoop (PWA 36001)
P06-053	Lubricant, Sealing Ring (PWA 36500)
R P06-054	Anti-seize, Paste (PWA 36246)
P11-027	Solvent, Petroleum (PMC 9001)

C. General Assembly Requirements

(1) When it is necessary to apply heat for assembly in this procedure, use a minimum temperature differential of 125°F (51.7°C) between the parts that will be assembled to each other. Do not increase the temperature more than 300°F (148.9°C) on any part.

(2) When it is necessary to apply heat for assembly, special heaters are specified in the procedure which follows. However, you can use an optional flameless torch or flame torch as specified in the steps which follow.

(3) When you cannot increase the temperature of a component in an oven (or it is only necessary to apply heat to the flange of a component) the use of Clements Cadillac flameless electric heat gun, Model FT 1000 is recommended.

(4) As an alternative, apply heat with a flame torch for parts which have a tight fit, such as disks, hubs, seals and shafts.

DIFFUSER AND COMBUSTOR - ASSEMBLY-01

WARNING: WEAR GLOVES WHEN YOU TOUCH HOT PARTS TO PREVENT BURNS.

CAUTION: HEAT PARTS EQUALLY. DO NOT INCREASE THE TEMPERATURE MORE THAN THE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO TOUCH ANY NON-METAL PART. THE FLAME WILL DAMAGE OR BURN NON-METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT MAKES A PENCIL POINT FLAME.

(a) Use a flame torch with a maximum output of 80,000 BTU an hour, and a torch head with a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY METHOD TO MAKE A MARK THAT PERMITS CARBON, ZINC, COPPER, LEAD (OR SIMILAR RESIDUE) TO STAY ON THE PART. THIS CAN CAUSE A REDUCTION IN FATIGUE STRENGTH. THIS IS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN A LARGE AMOUNT OF HEAT IS APPLIED TO THE PART.

(b) Use the flame torch as follows:

1 Continuously monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a better temperature indicator and recommended. However, you can use a heat sensitive crayon.

2 Equally apply heat to the part in the snap diameter area. Turn the part or move the torch around the part.

3 Continuously monitor the temperature of the part.

4 Apply only enough heat to make the tight fits larger and permit assembly.

D. Procedure

NOTE: Clock positions are clockwise from the front, unless otherwise specified.

Subtask 72−41−00−430−076:

(1) Install diffuser case in PWA 25039 Build Stand. See Figure 1001.

NOTE: If you have a twin overhead rail system you must use PWA 85983 Stabilizer Adapter with PWA 85751 Handling Brackets.

(a) Install two PWA 85751 Handling Brackets (1001/4) to the diffuser case.

1 Use a hoist and install the longer front flange of the brackets to the rear of the front flange of the diffuser case at the 3 and 9 o'clock locations, install the four pins in the front flange of the bracket into the four boltholes in the diffuser case front flange. Install the shorter rear flange of the bracket to the front of the diffuser case rear flange and attach with the detail nuts and bolts.

2 Install the double spool bracket in the rear most two holes as marked on the bracket.

WARNING: USE TWO OPERATORS WHEN YOU INSTALL OR TRUNNION THE CASE IN THE STAND. WHEN THE BALL LOCK PIN IS REMOVED THE CASE CAN TRUNNION BY ITSELF, AND POSSIBLY CAUSE INJURY.

(b) Use a hoist (1001/1), PWA 28657 Sling (1001/2), and two PWA 76154 Adapters (1001/3), trunnion and install the diffuser case into PWA 25039 Stand (1001/5). Hold in position with a ball lock pin.

(c) Remove hoist, PWA 28657 Sling, and two PWA 76154 Adapters.

(d) Face the rear of the diffuser case and use tape to mark the rear flange in line with the first hole to the left of the dowel pin.

(e) Face the front of the diffuser case and mark the flange at the offset hole. These marks will indicate bottom center line and 6 o'clock position of the diffuser case.

Subtask 72−41−00−430−077:

(2) Install the No. 3 bearing (breather) tube assembly. See Figure 1002.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the tube assembly and blow shop air through the tube assemblies to make sure there is no foreign material.

(b) Install the seal ring (1002/4) in the center groove on the assembly.

(c) (Pre SB PW4ENG 72−648) Install the two−piece seal ring (1002/2) at the end groove on the assembly. Assemble it with the inner ring joint 180° ± 20° from the outer ring joint.

(d) (Post SB PW4ENG 72−648) Install the one−piece seal ring (1002/2) at the end groove on the assembly. Assemble it with the inner ring joint 180° ± 20° from the outer ring joint.

(e) Install the large seal ring (1002/5) in the large ring groove at the end of the assembly.

(f) Install the gasket (1002/3) with a small amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 onto the tube end.

(g) Install the tube assembly in the case at the 11 o'clock position (as viewed from the front).

(3) Install the No. 3 bearing (scavenge) tube assembly (1002/11). See Figure 1002.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the tube (1002/11) and blow shop air through the tube assembly to make sure there is no foreign material.

(b) Install the seal ring (1002/12) in the center groove on the assembly.

(c) (Pre SB PW4ENG 72-648) Install the two-piece seal ring (1002/10) at the end groove on the assembly.

(d) (Post SB PW4ENG 72-648) Install the one-piece seal ring (1002/10) at the end groove on the assembly.

(e) Install the large seal ring (1002/9) in the large ring groove at the end of the assembly.

(f) Install the gasket (1002/8) with a small amount of Beeswax P05-395 or Paraffin Wax Blend P05-396 onto the tube end.

(g) Install the tube assembly in the case at the 5:30 o'clock position (as viewed from the front).

(4) Install the diffuser seal air vent tube assemblies (1002/6). See Figure 1002.

NOTE: Attach a temporary safety wire around the air vent tube so that the tube will not fall back into the diffuser case and cause unnecessary engine disassembly at a later engine assembly procedure.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from diffuser seal air vent tube assemblies and blow shop air through the tubes to make sure there is no foreign material.

(b) Install the seal rings (1002/7) in the groove on the two tube assemblies.

(c) Install the tube assemblies through the case struts at the 1:00 and 8:30 o'clock positions (as viewed from the front).

(5) Install the turbine blade cooling tubes (1003/1). See Figure 1003.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from two turbine blade cooling tubes (1003/1) and blow shop air through the tubes to make sure there is no foreign material.

(b) Install the seal ring (1003/2) in the groove on each tube.

(c) Install the seal ring (1003/3) in the grooves at each end of the two seal ring transfer (turbine blade cooling) tubes (1003/4).

(d) Install the transfer tubes (1003/4) to the cooling tubes (1003/1) while you engage the tabs on the transfer tubes with the slots on the cooling tubes.

(e) Install the cooling tubes with the transfer tubes through the case struts at the 6:30 and 9:30 o'clock positions (as viewed from the front).

Subtask 72−41−00−430−078:

(6) Install the No. 3 bearing (compartment) cooling tube (1004/9). See Figure 1004.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from No. 3 bearing (compartment) cooling tube and blow shop air through the tube to make sure there is no foreign material.

(b) Install the large seal ring (1004/8) in the ring groove on the tube (1004/9).

(c) Install the small seal rings (1004/7) in the rear groove on the tube (1004/9).

(d) Install the tube (1004/9) through the case strut at the 7:30 o'clock position (as viewed from the front).

(7) Install the No. 3 bearing and airframe (oil vent and turbine cooling) manifold assemblies (1004/6). See Figure 1004.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the No. 3 bearing and airframe (oil vent and turbine cooling air duct sensing outer) manifold assemblies and blow shop air through the manifolds to make sure there is no foreign material.

(b) Install the seal rings (1004/5) in the grooves on both manifold assemblies.

(c) Install the manifold assemblies through the case struts at the 12:30 and 4 o'clock positions (as viewed from the front).

(8) Install the No. 3 bearing (oil) pressure tube assembly (1004/10). See Figure 1004.

NOTE: Make sure correct seal ring size is used to get correct fit with seal ring groove.

(a) Remove all protective closures from the No. 3 bearing (oil) pressure tube assembly and blow shop air through the tube assembly to make sure there is no foreign material.

(b) Install the seal ring (1004/1) in the center groove on the tube assembly.

(c) Install the seal ring (1004/3) at the end groove on the tube assembly.

(d) Install the large seal ring (1004/2) in the large ring groove on the tube.

(e) Install the gasket (1004/4) with a small amount of Beeswax P05−395 or Paraffin Wax Blend P05−396 onto the tube (1004/10).

(f) Install the tube assembly through the case strut at the 2 o'clock position (as viewed from the front).

Subtask 72−41−00−430−079:

(9) Install the HPC (rear) exit brush seal assembly (called brush seal) (1005/10) and transfer tubes. See Figure 1005.

NOTE: Clock positions are clockwise from the rear. Make sure the correct seal ring size is used to get the correct fit with the seal ring groove.

(a) Install the brush seal (1005/10), carefully while you align the installed tubes. Make sure that the seal rings on the tubes are correctly engaged.

NOTE: Use two assemblers if necessary.

(b) Attach the brush seal to the diffuser case with bolts, (1005/1) lubricated with Engine Oil P03−001, and nuts (1005/11).

(c) Seat the brush seal with bolts, slowly tightened, and nuts. Use a 180 degree opposite bolt pattern until the ring is fully seated against the diffuser case flange.

(d) Torque the nuts (1005/11) to 85 − 95 lb−in. (9.604 − 10.734 N.m). Loosen and torque the nuts again to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(e) Install the seal ring (1005/4) in the groove on the seal ring transfer (No. 3 bearing cooling front) tube (1005/6).

(f) Face the rear of the diffuser case and find the tube that extends through the brush seal at the 4:30 o'clock position. Make sure that the seal ring is engaged in the ring groove on tube.

(g) Carefully install the transfer tube (1005/6) over the tube at the 4:30 o'clock position, with the tabs toward the brush seal. Engage the tabs with the slots in the brush seal. Make sure that the transfer tube is fully seated in the brush seal.

(h) Install the seal ring (1005/7) in the groove on the seal ring transfer (No. 3 bearing cooling rear) tube (1005/3).

(i) Carefully install the transfer tube (1005/3) over the tube at the 4:30 o'clock position, engage the tabs in the slots of the installed transfer tube. Make sure the transfer tubes are fully seated.

(j) Install the seal ring (1005/5) in the groove on two No. 3 bearing packing transfer (breather and scavenge) tubes (1005/2).

(k) Carefully install the transfer tubes (1005/2) over the tubes at the 1 and 6:30 o'clock positions, with tabs toward the brush seal. Engage the tabs with the slots in the brush seal. Make sure the transfer tubes are fully seated in the brush seal.

(l) Install the seal ring (1005/8) in the groove on the transfer (oil pressure) tube (1005/9).

(m) Carefully install the transfer tube (1005/9) over the tube at the 10 o'clock position with tabs toward the brush seal. Engage the tabs with the slots in the brush seal. Make sure the transfer tube is fully seated in the brush seal.

Subtask 72−41−00−430−080:

(10) Install the turbine cooling duct sensing tube and oil vent tube. See Figure 1006.

NOTE: Clock positions are clockwise from the rear. Make sure the correct seal ring size is used to get the correct fit with the seal ring groove.

(a) Remove all protective closures from the turbine cooling duct sensing (inner airframe) tube assembly (1006/1) and blow shop air through the tube assembly to make sure there is no foreign material. See Figure 1006.

(b) Install the seal ring (1006/2) in the groove on the OD of the tube nut (1006/10).

(c) Install the tube assembly (1006/1) to the installed cooling manifold at the 11:30 o'clock position in the brush seal. The rear of the tube assembly should pass through the diffuser case flange. Handtighten the tube nut (1006/10).

(d) Remove all protective closures from the No. 3 bearing oil vent (inner) tube assembly (1006/3) and blow shop air through tube assembly to make sure there is no foreign material.

(e) Install the seal ring (1006/4) to the groove on the OD of the tube nut (1006/9).

(f) Install the tube assembly (1006/3) to the installed cooling manifold at the 8 o'clock position in the brush seal. Do not tighten tube nut at this time.

(g) Locate two countersunk holes in the diffuser case flange at approximately the 7 o'clock position and attach the tube assembly (1006/3) at two places with clamps (1006/5), brackets (1006/6), screws (1006/7) lubricated with Engine Oil P03-001, and nuts (1006/8).

(h) Torque both tube nuts (1006/9) and (1006/10) to 200 - 225 lb-in. (22.597 - 25.422 N.m). Loosen and torque the tube nuts again to 200 - 225 lb-in. (22.597 - 25.422 N.m). Install the Lockwire P05-289 to safety the tube nuts.

NOTE: Hold connector on mating tube with PWA 87006 Wrench while torquing with PWA 103081 Torque Adapter.

(i) Torque the screws that hold the clamps at two locations to 36 - 40 lb-in. (4.067 - 4.519 N.m).

(11) Install the No. 3 bearing housing and front seal and cooling air duct assembly (1007/5) in the diffuser case. See Figure 1007.

(a) Turn the diffuser case, rear end up, on PWA 85751 Handling Brackets and lock in position.

(b) Looking down into the rear of the diffuser case, install two PWA 25450 Aligning Pins (1007/4) 180 degrees apart to the inner flange of the case.

(c) Install three eye bolts, equally spaced, in the outer flange of the No. 3 bearing front cooling duct assembly and housing.

(d) With a three cable sling, lift and lower the No. 3 bearing front cooling duct assembly and housing into the diffuser case.

(e) Install the No. 3 bearing front cooling duct assembly and housing (1007/5) to the flange in the diffuser case while you carefully align the installed tubes and seal rings. Remove the sling and eye bolts.

(f) Align the four countersunk holes in the housing flange with the four smaller holes in the case inner flange. Attach with four screws (1007/3) lubricated with Engine Oil P03−001. Do not tighten screws.

NOTE: Make sure that the dowel pin in the assembly engages the dowel pin hole in the installed tube at approximately the 1 o'clock position.

(g) Make sure all the tubes are correctly aligned and the seal rings are still in place.

(h) Install eight work bolts (1007/1) and washers (1007/2), one to each side of the last four installed screws (1007/3).

(i) Carefully tighten the work bolts (1007/1) in a 180 degree opposite pattern until assembly is fully seated. Torque the work bolts to 290 lb−in. (32.766 N.m) maximum.

(j) Remove the two alignment pins (1007/4).

(k) Run down the four screws (1007/3) until bottomed, then back off screws one full turn. Torque screws 22 − 95 lb−in. (2.486 − 10.734 N.m).

(l) Remove the eight work bolts (1007/1) and washers (1007/2).

(m) Turn the diffuser case to the horizontal position and lock in place.

Subtask 72−41−00−430−081:

(12) Install the No. 3 bearing (breather) tube (1008/1), (oil) pressure tube (1008/3), and (scavenge) tube (1008/4). Also install the heat shields for these tubes and the (compartment) cooling tube (1008/2). See Figure 1008.

(a) Facing front of diffuser case, locate three large bosses (at 2:00, 5:30, and 11 o'clock) on airsealing ring. Attach the tubes (breather, pressure, and scavenge) at these locations using bolts, lubricated with Engine Oil P03−001.

(b) Torque the bolts to 125 − 170 lb−in. (14.123 − 19.207 N.m). Without loosening, continue to tighten to same limits until torque is maintained. Install the Lockwire P05−289 to safety the bolts.

(c) Install the heat shield halves over the oil pressure tube at 2:00 o'clock and the oil breather tube at 11 o'clock as follows:

1 Install the heat shield flange halves into the boss on the airsealing ring. Put the largest flat side of the heat shield flange against the bolts.

2 Install the inner heat shield halves around the tube assembly.

3 Install the outer heat shield halves over the inner heat shield halves. Use PWA 101455 Installation Clamp to hold the heat shield in position around the tube for the lockwire installation.

4 (Post SB PW4ENG 72−623) Attach the heat shield assembly with the Lockwire P05−365 at both ends and middle. Wrap the lockwire three full turns around the heat shield and make safe with three full twists. The twist must be outward away from the rotor.

5 Remove the installation clamp (PWA 101455).

(d) Install the heat shield halves over the oil scavenge tube at 5:30 o'clock and the compartment cooling tube at 7:30 o'clock as follows:

1 Install the heat shield flange halves into the boss on the airsealing ring for the oil scavenge tube. Put the largest flat side of the heat shield flange against the bolts.

2 Install the inner heat shield halves around the tube assembly.

3 Install the outer heat shield halves over the inner heat shield halves. Use PWA 101456 Installation Clamp to hold the heat shield in position around the tube for the lockwire installation.

4 (Post SB PW4ENG 72-623) Attach the heat shield assembly with the Lockwire P05-365 at both ends and middle. Wrap the lockwire three full turns around the heat shield and make safe with three full twists. The twist must be outward away from the rotor.

5 Remove the installation clamp (PWA 101456).

Subtask 72-41-00-430-082:

(13) Install the HPC exit brush seal support assembly (called brush seal support) (1009/1) and the compressor exit stator assembly (called stator) (1009/2). See Figure 1009.

(a) Put the brush seal support on clean paper on a bench with the OD surface down.

(b) Find the two larger flange holes with the six smaller holes in between. Mark a reference line on the front of the flange in line with the two large holes with a marking crayon.

NOTE: The threaded hole is at 12:30 o'clock, and one of the two large holes is at 11:00 o'clock.

(c) Chill the brush seal support for approximately ten minutes.

(d) Put the stator on clean paper on the bench with the slotted flange down.

(e) Find the two larger flange holes with the five slots in between. Mark a reference line in line with the two large holes with a marking crayon.

(f) Chill the stator for approximately ten minutes.

(g) Install PWA 87153 Heater on the inner front flange of the diffuser case as follows:

NOTE: You can use the optional flameless torch or the flame torch as described above to heat the inner front flange of the diffuser case.

1 The heater thermocouple must touch the flange.

2 Attach the PWA 29754 Heater Control to the receptacle and the thermocouple.

3 Start the heater element to increase the temperature of the diffuser case flange to 350° − 375°F (176.7° − 190.6°C).

4 Remove the heater and heater control.

(h) Look at the front of the diffuser case. Find the two large holes with the five smaller holes in between on the inner front flange. Mark a reference line in line with the two large holes with a marking crayon.

(i) Install PWA 87154 Guide Pin on the brush seal support as follows:

1 Put the guide pin called "12 o'clock" into the bolt hole at the 12 o'clock location.

NOTE: The 12 o'clock hole is adjacent to the threaded hole that is in between the two alignment marks.

2 Turn the knurled knob of the threaded rod to attach the guide pin to the brush seal support assembly.

(j) With marks aligned, install the chilled brush seal support in the diffuser case. If necessary, tap to seat.

(k) Remove the guide pin from the brush seal support.

(l) Install the PWA 101863 Alignment Pin on the compressor exit stator assembly as follows:

1 Put the alignment pin specified as 12 o'clock into the bolt slot adjacent to the jackscrew hole near the 12 o'clock location.

2 Turn the knurled knob of the threaded rod to attach the alignment pin to the compressor exit stator assembly.

(m) With marks aligned, install the chilled stator in the case over the brush seal support. If necessary, tap to seat.

(n) Remove the alignment pin from the compressor exit stator assembly.

(14) Install the stage 15 HPC airsealing ring nozzles (1009/4). See Figure 1009.

(a) Remove the protective closures from the ten Stage 15 HPC airsealing ring nozzles. Blow shop air through the nozzles to make sure there is no foreign material in the nozzles.

(b) Install the spacer plates (1009/5) to the 34 slots on the stator.

(c) Install the ten nozzle assemblies to the large holes in the stator flange, through to the bosses on the diffuser case. Nozzle openings must point in a counterclockwise direction.

(d) Attach the nozzles with bolts (1009/6), lubricated with Engine Oil P03-001, and nuts (1009/7) tightened by hand. Install the 14 lubricated bolts (1009/6) washers (1009/3) and nuts (1009/7) to the holes that remain.

(e) Torque the bolts to 85 - 95 lb-in. (9.604 - 10.734 N.m). Loosen them and torque again to 85 - 95 lb-in. (9.604 - 10.734 N.m).

Subtask 72−41−00−430−083:

(15) Install the No. 3 bearing (oil) pressure tube gasket and lock plate. See Figure 1010.

- (a) Find the pad at 2 o'clock where a manifold comes out of the side of diffuser case.
- (b) Install the gasket (1010/10) to the case pad.
- (c) Install the sleeve (1010/14) with small ID over the seal ring.
- (d) Install the plate lock (1010/11) with slot upward.
- (e) Install the shield (1010/12) with open end outward, aligning bolt holes.
- (f) Attach with bolts (1010/13) lubricated with Engine Oil P03−001. Tighten bolts fingertight.
- (g) Torque the bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(16) Install the No. 3 bearing and airframe manifold assembly lock plates and gaskets. See Figure 1010.

- (a) Find the pad at the 4 o'clock position with the manifold that extends through the outside of the diffuser case.
- (b) Install the gasket (1010/9) to the case pad.
- (c) Install the sleeve (1010/7) with small ID over the seal ring.
- (d) Install the plate lock (1010/8) with slot upward.
- (e) Attach with bolts (1010/6) lubricated with Engine Oil P03−001. Tighten bolts fingertight.

(f) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(g) Find the pad at the 1 o'clock position with the tube that extends through the outside of the diffuser case.

(h) Install the gasket (1010/5) to the case pad.

(i) Install the sleeve (1010/4) with small ID over the seal ring.

(j) Install the plate lock (1010/3) with slot upward.

(k) (Pre SB PW4ENG 72-570) No No. 3 bearing weep tube heat shield assembly installed.

1 Attach with bolts (1010/6) and (1010/22), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

2 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

3 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(l) (Post SB PW4ENG 72-570) No. 3 bearing weep tube heat shield assembly installed.

1 Install the heat shield (1010/23) over the plate lock (1010/8).

2 Attach with bolts (1010/24) and (1010/25), lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

3 Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limits until the torque is maintained.

4 Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(m) Install the cap assembly (1010/1). Torque to 270 - 300 lb-in. (30.506 - 33.895 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the cap assembly.

(17) Install the two covers (1010/16) and seals (1010/19). See Figure 1010.

(a) Put a gasket (1010/15) on the six-hole pads at 3:00 and 10:30 o'clock.

(b) Install a cover (1010/16) on each gasket. At the 10:30 o'clock location, install the bracket (1010/21) on the two forward holes of the cover. Install six bolts (1010/17), threads lubricated with Engine Oil P03-001, in each cover. Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(c) Install a seal ring (1010/18) on each seal (1010/19).

(d) Install the seals (1010/19) on the rods of the covers (1010/16) in the ID of the diffuser case. Install a nut (1010/20), threads lubricated with
R Lubricant P06-023 or Anti-seize Paste P06-054,
R on the rod. Torque the nut to 190 - 215 lb-in.
R (21.467 - 24.292 N.m).

Subtask 72-41-00-430-084:

(18) Install the No. 3 bearing (breather) tube lock plate. See Figure 1011.

(a) Find the pad at 11 o'clock. It has a tube that comes through the boss.

(b) Install a gasket (1011/6) on the pad.

(c) Install a sleeve (1011/5) in the gasket.

(d) Install a plate lock (1011/4) on the sleeve, slot to the rear.

(e) Install three bolts (1011/3), threads lubricated with Engine Oil P03-001. Tighten the bolts with your fingers.

(f) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(g) Install a tube nut (1011/2) on the tube. Install thrust wire (1011/1), lubricated with Engine Oil P03-001.

(19) Install the plate for the No. 3 bearing (scavenge) tube, which is at 5:30 o'clock. See Figure 1011.

(a) Install a gasket (1011/7) on the pad.

(b) Install a sleeve(1011/8) in the gasket.

(c) Install a plate (1011/9) on the sleeve.

(d) Install three bolts (1011/12), threads lubricated with Engine Oil P03-001, in the plate. Tighten the bolts with your fingers.

(e) Torque the bolts to 65 - 85 lb-in. (7.344 - 9.604 N.m). Do not loosen the bolts. Continue to tighten the bolts to the same limit until the torque is kept. Install the Lockwire P05-289 or Safety Cable P05-291 and Safety Cable Ferrule P05-292 to safety the bolts.

(f) Install a tube nut (1011/10). Install thrust wire (1011/11), lubricated with Engine Oil P03-001, in the tube nut.

(20) Install the No. 3 bearing cooling tube lock and elbow, which is at 7:30 o'clock. See Figure 1011.

CAUTION: INSTALL LOCK PLATES (1011/16) WITH SLOT GROOVE OUTWARD AND PIN INWARD. MAKE SURE THE LOCK PLATES ENGAGE THE INTERNAL TUBE LIP FLANGE AS SHOWN IN FIGURE 1011.

(a) At the boss at 7:30 o'clock, install the locks (1011/16) to flange lip of the internal tube and align the bolt holes.

(b) (Reference 1990) Hold the tube locks outward against the tube lip. Measure and be sure the end of the internal tube is 0.000 − 0.020 inch (0.000 − 0.508 mm) above the tube locks. If the measurement is not within this limit, install the locks again and be sure you engage the internal tube lip correctly.

(c) Install the gasket (1011/17) around OD of locks.

(d) Install the gasket (1011/15) over the locks with the raised lip against the tube. Align bolt holes.

(e) Install the elbow (1011/14) and align the bolt holes.

(f) Attach the elbow with ten bolts (1011/13), threads lubricated with Engine Oil P03−001. Tighten the bolts with your fingers.

(g) Torque bolts to 65 − 85 lb−in. (7.344 − 9.604 N.m). Do not loosen the bolts. Continue to tighten them to the same limits until the torque is kept. Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

(h) Install the washer (1011/18) to flat threaded end of the adapter (1011/19).

(i) Lubricate the flat threaded end of the adapter with Engine Oil P03−001, and install the adapter in the elbow.

(j) Torque the adapter to 450 − 550 lb−in. (50.843 − 62.142 N.m).

Subtask 72-41-00-720-053:

(21) Vacuum check the No. 3 bearing compartment. See Inspection/Check-05 Task 72-41-00-200-005.

Subtask 72-41-00-720-054:

(22) Airflow check the No. 3 bearing oil pressure system. Figure 1012.

NOTE: Airflow check is to make sure that the passages are not blocked or assembled incorrectly.

(a) Find the outside end of No. 3 bearing pressure tube assembly. Attach PWA 85565 Adapter to the outside end of the tube.

(b) Attach the air inlet hose from CTE 6070 Airflow Cart or CTE 5070 Airflow Cart to the larger threaded hole of the adapter.

(c) Attach the pressure sensing line to the smaller threaded hole.

(d) Airflow check the nozzle at 10 psig (68.9 kPa). Airflow rate must be 40 - 50 lb/hr (18.14 - 22.68 kg/hr).

(e) After airflow rate limits have been met, remove the adapter and airflow cart.

Subtask 72-41-00-430-085:

(23) Install the outer combustion chamber assembly. See Figure 1013.

(a) Install and attach the diffuser case to the front end down position in PWA 86508 Build Stand or PWA 85044 Build Stand.

(b) Remove the two PWA 85751 Handling Brackets from the diffuser case.

(c) Visually check the interior of the diffuser case for correct assemblies, foreign material or damage and that all details are attached. Pay particular attention to mating surfaces of carbon seal.

(d) Locate the 12 threaded bosses located around the OD of the diffuser case. Install PWA 85060 Alignment Pins to three equally spaced bosses in the case and retract the inner portion of the pins.

(e) Use PWA 27918 Sling or PWA 80555 Sling (1013/1) and lift the outer combustion chamber assembly (1013/2) and position over the diffuser case. Align the two igniter holes in the combustion chamber with the igniter bosses on the diffuser case at the 4 o'clock position, as viewed from the rear.

(f) Carefully lower the combustion chamber into the diffuser case while you keep the igniter bosses aligned. Lower the combustion chamber so that the lugs on the bottom of the chamber are even with the bosses on the diffuser case. Push the inner portion of the pins in to align the combustion chamber mount lugs with the diffuser case at three places.

(g) Lubricate the threads and seating surface of the twelve doweled end retaining bolts (1013/3) with Lubricant P06−023 and wipe clean any lubricant from other bolt surfaces before you installation. Install nine lubricated bolts (1013/3) and washers (1013/4) through the outside of diffuser case to locate the combustion chamber mount lugs. Wipe clean any excess lubricant from the case and/or bolt surfaces.

(h) Remove one aligning pin at a time and install the three remaining bolts and washers.

(i) (Reference 402) Remove sling. Torque bolts (1013/3) 500 − 600 lb−in. (56.492 − 67.791 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the bolts.

Subtask 72−41−00−430−086:

(24) Install the igniter plugs. See Figure 1014 and Figure 1015.

NOTE: Currently there are (2) two igniter plug guide configurations installed in the outer combustion chamber. (Pre SB PW4ENG 72-601) chambers have a short sleeve and a shield. (Post SB PW4ENG 72-601) chambers have an extended, necked-out sleeve and a lock.

(a) Measure the igniter plug immersion depth. Use PWA 75509 Immersion Gage (1014/7).

NOTE: This procedure is applicable to the two igniter plug locations.

1 If necessary, clean threads of boss with the PWA 24524 Tap.

2 Install the key washer (1014/2) to the igniter plug boss (1014/3) with the tabs to the boss. Do not bend the tabs.

3 Install the boss and key washer to the igniter plug (1014/1) and tighten by hand.

4 (Reference 365 or 386) Measure Dimension A from the plug tip to the bottom face of the boss. Write measurement as Dimension A.

5 Remove the igniter plug and key washer from the boss and put them on the bench.

6 Put the gage master (1014/5) between the gage hook and the gage base. Set the gage bezel to zero.

7 Install the gage into the igniter boss hole in the diffuser case until the gage base is seated on the face of the case boss.

8 Turn the gage base to get a clear view of the dial gage face.

9 Hold the gage base. At the same time, turn the probe until the notch in the probe is to the rear of the case.

10 Push in on the probe and slide the gage to the rear of the case to put the gage hook against the rear ID surface of the outer combustion chamber (1014/6).

11 Release the probe and record the dial gage reading. Add the gage reading to 2.200 inches (55.880 mm) if the reading is a plus reading. Subtract the gage reading from 2.200 inches (55.880 mm) if the reading is a minus reading. Result is Dimension B. Remove the gage.

12 (Engines Without Talon Low Emission Combustion Chambers) Add 0.125 inch (3.175 mm) to Dimension B and subtract that total from Dimension A. The result, Dimension C, is the necessary spacer thickness.

13 (Engines with Talon Low Emission combustion chambers) Add 0.075 inch (1.905 mm) to Dimension B and subtract that total from Dimension A. The resulting dimension, Dimension C, is the desired spacer thickness.

(b) Use a classified spacer (1014/4) or a combination of spacers to obtain Dimension C plus or minus 0.010 inch (0.254 mm). Use a maximum of two spacers for each plug. The total combined thickness of spacer(s) must not be more than 0.300 inch (7.620 mm).

(c) If necessary, clean the threads in the diffuser case port using PWA 27641 Tap.

(d) Fully clean the igniter plug, igniter boss and diffuser case threads with Petroleum Solvent P11−027.

(e) Install the key washer to the plug boss with the tabs to the boss. Bend the tabs over to attach the key washer to the boss.

(f) Lubricate the outer threads of the plug boss with Lubricant P06−023.

(g) (Reference 400) Install the classified spacer(s) to the boss. Install the boss to the diffuser case. Torque the boss to 375 − 440 lb−in. (42.869 − 49.713 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the boss.

(h) Apply Thread Lubricant P06−023 to the igniter plug threads.

(i) (Reference 401) Install the igniter plug to the boss. Torque the plug to 300 − 360 lb−in. (33.895 − 40.675 N.m).

Subtask 72−41−00−430−087:

(25) Install the fuel injectors and support assemblies. See Figure 1016.

NOTE: Where brackets are installed with the fuel injectors, they are installed on top of the fuel injectors.

(a) Use tape above each fuel injector boss to identify each boss. The first boss to the right of the bottom centerline is No. 12, and the first boss to left of the bottom centerline is No. 13. Continue to number bosses in a clockwise direction to 24.

(b) Place 24 fuel injectors (1016/7) on the bench and install a gasket (1016/5), lubricated with Beeswax P05−395 or Paraffin Wax Blend P05−396, to each injector.

(c) Install fuel injectors at bosses marked No. 1, 2, 3 and 4 through the diffuser case with the nozzle upward. Attach with bolts (1016/6) lubricated with Engine Oil P03−001, fingertight.

(d) At the injector boss marked No. 5, install the fuel injector and bracket (1016/8). Attach with bolts lubricated with Engine Oil P03−001, fingertight.

(e) At boss No. 6 install the fuel injector and bracket (1016/10). Attach with lubricated bolts fingertight.

(f) At boss No. 7 install the fuel injector and bracket (1016/11). Attach with lubricated bolts fingertight.

(g) At boss No. 8 install the fuel injector and bracket (1016/12). Attach with lubricated bolts fingertight.

(h) Install a fuel injector at bosses No. 9 through 17 and attach with lubricated bolts fingertight.

(i) At boss No. 18 install the fuel injector and bracket (1016/1). Attach with lubricated bolts fingertight.

(j) Install fuel injector at boss No. 19 and attach with lubricated bolts fingertight.

(k) At boss No. 20 install the fuel injector and bracket (1016/2). Attach with lubricated bolts fingertight.

(l) At boss No. 21 install the fuel injector and bracket (1016/3). Attach with bolts lubricated with Engine Oil P03−001.

(m) Install the fuel injectors at bosses No. 22, 23 and 24. Attach with lubricated bolts fingertight.

(n) Make sure all the fuel injectors (1016/7) are correctly installed and torque bolts (1016/6) evenly around the case to 65 − 85 lb−in. (7.344 − 9.604 N.m). Do not loosen the bolts. Continue to torque to the same limits until the torque stays at the limit.

(o) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the two upper bolts together on the fuel injectors at Locations No. 1, 3, 4, 6, 7, 9, 10, 12, 13, 15, 16, 18, 19, 21, 22 and 24.

NOTE: The lower bolt at the above locations will be lockwired to fuel manifold nuts in a later assembly operation.

(p) Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the three bolts together on the fuel injectors at Locations No. 2, 5, 8, 11, 14, 17, 20 and 23.

NOTE: Do not remove tape used to identify the fuel injector location numbers at this time.

Subtask 72−41−00−430−088:

(26) Install the diffuser case in PWA 86508 Build Stand or PWA 85044 Build Stand and align flange holes No. 37 through 43 with cutout in build stand.

NOTE: See the referenced tables for lubricants, torques, and lockwire that are necessary at the different locations.

NOTE: Clock locations are clockwise from the rear.

(a) Install two bolts (1017/2) and washers (1017/1). See Figure 1017 and Figure 1018 and Table 1017 and Table 1018.

Bracket/ Plug/Cover Reference Number	Position On Diffuser Case	Bolt Torque lb−in. (N.m) Lubricant Lockwire	Service Bulletin Reference
2 Bolt	1 o'clock	65 − 85 (7.344 − 9.604) P03−001 Lockwire	
3 Support	2 o'clock	65 − 85 (7.344 − 9.604) P03−001 Lockwire	
4 Bracket	3:15 o'clock	125 − 170 (14.123 − 19.207) P03−001 Lockwire	
5 Bracket	4 o'clock	65 − 85 (7.344 − 9.604) P03−001 Lockwire	

Table 1017

DIFFUSER AND COMBUSTOR - ASSEMBLY-01

Bracket/ Plug/Cover Reference Number	Position On Diffuser Case	Bolt Torque lb-in. (N.m) Lubricant Lockwire	Service Bulletin Reference
6 Bracket	5:15 o'clock	65 - 85 (7.344 - 9.604) P03-001 Lockwire	

Table 1017 (Continued)

Bracket/ Plug/Cover Reference Number	Position On Diffuser Case	Bolt Torque lb-in. (N.m) Lubricant Lockwire	Service Bulletin Reference
1 Bracket	7 o'clock	65 - 85 (7.344 - 9.604) P03-001 Lockwire	
3 Bracket	8:45 o'clock	65 - 85 (7.344 - 9.604) P03-001 Lockwire	
6 Cover	9:15 o'clock	65 - 85 (7.344 - 9.604) P03-001 Lockwire	
9 Bracket	9:45 o'clock	125 - 170 (14.123 - 19.207) P03-001 Lockwire	

Table 1018

(b) Install the brackets with bolts to the pads. See Figure 1017 and Figure 1018 and Table 1017 and Table 1018.

(c) (Pre SB PW4ENG 72-699) Install a cover (1018/6) with gasket (1018/5) to the case with two bolts (1018/7).

(d) Install a gasket (1019/1) and cover (1019/2) on the diffuser case and attach with six bolts (1019/5). Install a gasket (1019/3) on the adapter (1019/4). Install the adapter in the cover. See Figure 1019 and Table 1019.

Bracket/ Plug/Cover Reference Number	Position On Diffuser Case	Bolt Torque lb-in. (N.m) Lubricant Lockwire	Adapter Torque lb-in. (N.m) Lubricant	Service Bulletin Reference
2 Cover	12:30 o'clock	65 - 85* (7.344 - 9.604)* P03-001 Lockwire	110 - 120 (12.428 - 13.558) No Lubricant	
7 Plug	1:30, 4:15, 5:45 o'clock	40 - 50 (4.519 - 5.619) P06-023 Lockwire		
8 Cover	2:00 o'clock	65 - 85* (7.344 - 9.604)* P03-001 Lockwire	110 - 120 (12.428 - 13.558) P03-001	
14 Adapter	3:00 o'clock		110 - 120 (12.428 - 13.558) No Lubricant	
18 Plug	5:00 o'clock	40 - 50 (4.519 - 5.619) P06-023 Lockwire		

*Do not loosen the bolts as you tighten them. Continue to tighten them to the same limits until the torque is kept.

Table 1019

(e) Install a gasket (1019/12) and cover (1019/8) on the diffuser case and attach with three bolts (1019/11). Install a gasket (1019/9) on the adapter (1019/10). Install the adapter.

(f) (Post SB PW4ENG 73−163) Install the EEC thermocouple probe (TT3) (1019/15) as follows:

1 Install the gasket (1019/16) to the probe (1019/15).

2 Lubricate the probe threads with Engine Oil P03−001.

3 Install the probe and gasket to the boss at the 2:30 o'clock position behind the fuel injector bosses.

4 (Reference 411) Remove lockwire between the body nut and coupling nut. Loosen the coupling nut from the body nut. Torque the body nut (to the case) to 95 − 100 lb−in. (10.734 − 11.298 N.m). Install the Lockwire P05−289 or Safety Cable P05−291 and Safety Cable Ferrule P05−292 to safety the body nut to the case.

5 Attach the PWA 87649 Angle Gage to the two bolt hole boss of the diffuser case on the right side (horizontal centerline) with hex head screws. Move the gage guide into position.

6 Turn the probe so the two larger studs are to the right as shown. Hold the probe in place.

7 Touch the side of the thermocouple probe with the guide and tighten the hand knob to hold the guide assembly in position. This will correctly position the thermocouple probe for the electrical harness alignment connection.

8 (Reference 410) Torque the coupling nut to 95 − 100 lb−in. (10.734 − 11.298 N.m). Install lockwire from the coupling nut to the body nut.

(g) Install six borescope plugs (1019/7) and (1020/7) with gaskets (1019/6) and (1020/6). See Figure 1019 and Figure 1020 and Table 1019 and Table 1020.

Bracket/ Plug/Cover Reference Number	Position On Diffuser Case	Bolt Torque lb-in. (N.m) Lubricant Lockwire	Adapter Torque lb-in. (N.m) Lubricant	Service Bulletin Reference
3 Plug	7:00 o'clock	40 - 50 (4.519 - 5.619) P06-023 Lockwire		
4 Cover	7:30 o'clock	65 - 85* (7.344 - 9.604)* P03-001 Lockwire		
7 Plug	7:30, 9:15,	40 - 50 (4.519 - 5.619) P06-023 Lockwire		

*Do not loosen the bolts as you tighten them. Continue to tighten them to the same limits until the torque is kept.

Table 1020

(h) Install two additional plugs (1019/18) and (1020/2) with gaskets (1019/17) and (1020/1).

(i) Install a gasket (1020/5) and cover (1020/4) on the diffuser case and attach with six bolts (1020/2). See Figure 1020 and Table 1020.

Subtask 72-41-00-430-089:

(27) (Reference 407) Install the fuel injector supply manifold assemblies. See Figure 1021.

CAUTION: FOR ALL PACKING LUBRICANTS, APPLY ONLY A THIN COAT OR THE FUEL SYSTEM CAN BECOME BLOCKED.

(a) Install the packings (1021/3), lubricated with Engine Oil P03-001 or Sealing Ring Lubricant P06-053 to the packing groove on each fuel injector.

(b) Remove closures from manifold assembly (1021/2) and blow shop air through assembly to make sure there is no foreign material.

(c) Using Engine Oil P03-001, lubricate threads of tube nuts (1021/1) on manifold assembly (1021/2) at three places.

(d) Install the manifold assembly (1021/2) to fuel injectors No. 10, 11 and 12. Attach the tube nuts (1021/1) fingertight at three places.

(e) Remove closures from the remaining seven manifold assemblies (1021/4) and blow shop air through assembly to make sure there is no foreign material.

(f) Using Engine Oil P03-001, lubricate threads of tube nuts on manifold assemblies.

(g) Install the manifold assemblies (1021/4) to the remaining fuel injectors. Connect the tube nuts fingertight.

NOTE: Tube nuts are torqued after the fuel distribution system leak test has been accomplished. Refer to Assembly-03 Task 72-41-00-400-003.

E. Postrequisites

(1) For diffuser combustor assemblies which have the No. 3 bearing outer race installed, see 72-00-41, Installation-01 Task 72-00-41-420-001 for installation of the diffuser combustor onto the high pressure compressor. For diffuser combustor assemblies without the No. 3 bearing outer race installed, see 72-00-41, Installation-14 Task 72-00-41-420-014 for installation of the diffuser combustor onto the high pressure compressor.

(Task 72-41-00-400-001-A)

Task 72-41-00-400-002-001:

1. Assemble No. 3 Bearing Duct And Housing Including Bearing Outer Race - (Hydraulic Wrench Method)

NOTE: To assemble No. 3 bearing duct and housing by means of mechanical wrench method, See Assembly-04 Task 72-41-00-400-002-002.

NOTE: For alternate procedure not requiring installation of No. 3 bearing outer race, outer race installed after diffuser combustor group is installed into HPC, See Assembly-05 Task 72-41-00-400-004.

A. Prerequisites

(1) See Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 18872	Wrench, Hydraulic*
PWA 28814	Pump, Electric*
PWA 28815	Cart*
PWA 29510	Pump, Hydraulic*
PWA 29754	Control
PWA 29855-3	Pin
PWA 29855-5	Pin (Two Required)
PWA 33732	Wrench, Hydraulic*
PWA 75046	Cart*
PWA 80070	Wrench, Hydraulic*
PWA 85048	Base
PWA 85049	Drift
PWA 85051	Adapter, Wrench*
PWA 85052	Wrench, Torque*
PWA 85056	Cover (Optional To PWA 85802)
PWA 85057	Storage Stand
PWA 85167	Adapter
PWA 85199	Fixture
PWA 85541	Wrench
PWA 85542	Wrench
PWA 85679	Heater (Optional To PWA 85795)
PWA 85795	Heater
PWA 85802	Cover
PWA 85901	Riveter

DIFFUSER AND COMBUSTOR - ASSEMBLY-02

Special Tools:

(CONTINUED)

PWA 86546	Adapter (Optional To PWA 85199)
PWA 87354	Wrench, Hydraulic*
PWA 88100	Plate, Anchor*

*Refer to Table 1001 for tool options. Only Table 1001 shows the correct combinations of tools for installation of the No. 3 bearing (outer race) retaining nut.

NOTE: The PWA 86546 Adapter is an optional tool that will permit PWA 85167 Adapter to be mounted to an approved bench positioner when the electric motorized PWA 85199 Fixture is not available.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-026	Ink (Marking) (PMC 4057-1)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	2	72-41-00/9/10
Gasket	1	72-41-00/9/5
Gasket	1	72-41-00/10/160
Gasket	9	72-41-00/9/160
Key Washer	2	72-41-00/10/80
Key Washer	4	72-41-00/10/10
Key Washer	3	72-41-00/10/140
Rivet	1	72-41-00/12/40
Seal Ring	1	72-41-00/9/185
Seal Ring	2	72-41-00/9/195

C. Procedure

Subtask 72-41-00-430-068:

(1) Install No. 3 bearing outer race. See Figure 1001.

(a) Using hoist, place PWA 85048 Base (1001/3) on bench. Remove base lifting eye and screw into storage hole on OD of base.

(b) Install No. 3 bearing housing (1001/2), threaded ID up, aligning four pins in PWA 85048 Base (1001/3) with bolt holes in housing (1001/2).

(c) Locate two dimples on top surface (1001/6) of No. 3 bearing housing (1001/2) threaded ID. Mark a line between the dimples using Ink P05−026.

(d) Install PWA 85679 or PWA 85795 Heater (1001/7) to rear flange of housing (1001/2). Connect power and thermocouple cables to PWA 29754 Control or equivalent (1001/1).

(e) Set heater (1001/7) to 300°F (149°C) and heat housing (1001/2) for fifty five to sixty minutes.

(f) Wearing clean gloves, place No. 3 bearing assembly on clean waxed paper on bench.

(g) Separate outer race (1001/4) from inner race and rollers (1001/5) and place them, serial number up on bench.

(h) Verify bearing inner and outer race serial numbers are the same.

(i) Place bearing inner race and rollers (1001/5) in sealed container and retain with diffuser case for future installation.

(j) Turn off heater (1001/7). Disconnect control (1001/1) and remove heater (1001/7) from housing (1001/2).

(k) Install No. 3 bearing outer race (1002/2) into housing (1002/3) with serial number up and aligning "X" on outer race (1002/2) with ink mark (1002/4) on housing (1002/3). See Figure 1002.

(l) With PWA 85049 Drift (1002/1) and standard arbor press, drift outer race (1002/2) into housing (1002/3) and seat.

(m) Using feeler gage verify outer race (1002/2) is seated in housing (1002/3).

DIFFUSER AND COMBUSTOR − ASSEMBLY−02

CAUTION: A NEW OR RE−SILVER PLATED NO. 3 BEARING (OUTER RACE) RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR. NUT MAY BE RE−SILVER PLATED BY 72−41−83, REPAIR−01 PW4000 Series CIR, PN 51A357.

(2) Install the No. 3 bearing (outer race) retaining nut as follows. Refer to Figure 1003. Refer to Table 1001 for the correct combination of tools.

PWA Torque Wrench	PWA Wrench Adapter or Holding Adapter	PWA Hydraulic Wrench	PWA Anchor Plate	PWA Pump	PWA Cart
85052	85051	33732	-----	28814 or 29510	75046
85052	85051	18872	-----	28814 or 29510	75046 or 28815
85053	85054	87354	88100	28814 or 29510	75046
85053	85054	80070	88100	28814 or 29510	75046

Matrix Of Tools Used To Install The
No. 3 Bearing (Outer Race) Retaining Nut
Table 1001

(a) (Method 1)

1 Lubricate No. 3 bearing (outer race) retaining nut (1003/6) with Engine Oil P03−001.

2 Install retaining nut (1003/6) in housing (1003/3) with slots up. Handtighten.

3 Install PWA 85051 Wrench Adapter (1003/7), spline end up, over the pilot of PWA 85048 Base (1003/5) and rotate to engage the four slots with the four keys of the base (1003/5).

4 Secure PWA 85052 Torque Wrench (1003/8) to a hydraulic wrench (1003/1) and install over the adapter (1003/7), engaging the slots on the outer race retaining nut (1003/6).

(b) (Method 2)

1 Install the No. 3 bearing housing in PWA 85048 Base, large OD up, aligning the four pins in the base with the bolt holes in the housing.

2 Install PWA 85054 Adapter in the slots of the retaining nut.

3 Install PWA 85053 Torque Wrench over the adapter and on the nut, engaging the teeth of the wrench in the slots of the nut.

4 With a hoist, lift a hydraulic wrench from a cart.

5 Install the hydraulic wrench on the torque wrench.

6 Install PWA 88100 Anchor Plate on the hydraulic wrench, engaging the pins of the wrench in the holes of the anchor plate.

CAUTION: TO AVOID INCORRECT TORQUE READING, RETAINING NUT (1003/6) MUST NOT BE TORQUED UNTIL NO. 3 BEARING HOUSING (1003/3) HAS RETURNED TO ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

CAUTION: NO. 3 BEARING (OUTER RACE) RETAINING NUT MUST BE RE−SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED. NUT MAY BE RE−SILVER PLATED BY 72−41−83, REPAIR−01 PW4000 Series CIR, PN 51A357.

(c) (Reference 975) Torque retaining nut (1003/6) to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence aligning one rivet hole in retaining nut (1003/6) with one rivet hole in housing (1003/3).

(d) Remove the tools from the nut.

(e) Install rivet (1003/4) into aligned holes in housing (1003/3) and retaining nut (1003/6) and with PWA 85901 Hand Riveter, flare rivet (1003/4) to secure. See Chapter/Section 70−43, Standard Practices Manual, PN 585005.

(f) Remove housing assembly (1003/3) from base (1003/5) and place on clean paper, on bench large OD up.

(g) Position PWA 85802 or PWA 85056 Protective Cover (1003/2) over retaining nut (1003/6) installed in housing (1003/3). If PWA 85056 Protector Cover is used, slowly rotate cover until the three spring plungers seat in holes in retaining nut (1003/6).

Subtask 72−41−00−430−069:

(3) Assemble No. 3 bearing front (carbon) seal assembly and housing and outer race. See Figure 1004.

(a) Install No. 3 bearing housing and outer race (1004/7) small ID down into PWA 85167 Adapter (1004/6) mounted on PWA 85199 Bench Fixture (1004/4). Secure housing (1004/7) with six bolts (1004/12) wrench tight.

(b) Rotate housing (1004/7) and adapter (1004/6) so small OD is facing up.

(c) Place No. 3 bearing front (carbon) seal assembly (1004/1) on bench large OD up. Locate three hole pad inside seal assembly (1004/1).

(d) Install No. 3 bearing nozzle assembly (1004/11) small nozzle toward carbon seal. Secure fingertight with three key washers (1004/9) and bolts (1004/10) lubricated with Engine Oil P03−001.

(e) Torque bolts (1004/10) 65 − 85 lb−in. (7.344 − 9.604 N.m).

(f) Bend tabs on key washers (1004/9) to secure bolts (1004/10), see locking devices 70−53, Standard Practices Manual, PN 585005.

(g) Install gasket (1004/2) to inner flange on bearing housing (1004/7).

(h) Install two PWA 29855−3 Guide Pins (1004/8) 180 degrees apart to seal assembly (1004/1) flange.

(i) Install seal assembly (1004/1) to housing (1004/7) aligning offset holes. Secure with eight work bolts (1004/3) lubricated with Engine Oil P03−001, placed on each side of four countersunk screw holes fingertight. Rotate seal assembly and housing large OD up and tighten work bolts in a 180 degrees pattern until seal assembly is fully seated against housing. Ensure all bolt holes are aligned.

(j) Remove guide pins (1004/8).

(k) Install four screws (1004/5) lubricated with Engine Oil P03−001, to countersunk holes in housing (1004/7).

(l) Torque screws (1004/5) 22 − 85 lb−in. (2.486 − 9.604 N.m) loosen and retorque 22 − 85 lb−in. (2.486 − 9.604 N.m).

(m) Remove eight work bolts (1004/3) from flange.

Subtask 72−41−00−430−070:

(4) Assemble No. 3 bearing front cooling duct assembly and No. 3 bearing seal assembly and housing. See Figure 1005.

(a) Rotate seal assembly and housing large OD down.

(b) Chill No. 3 bearing front cooling duct assembly (1005/8) for five to ten minutes.

(c) Install nine gaskets (1005/7) to nine washers (1005/6), lightly waxed in place with Beeswax P05−395 or Paraffin Wax Blend P05−396. Lubricate nine bolts (1005/5) with Engine Oil P03−001.

(d) Install two large gaskets (1005/11) to bosses on seal assembly (1005/9), below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(e) Install one small gasket (1005/10) to boss on seal housing (1005/9) below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(f) Install two PWA 29855−5 Guide Pins (1005/12) 180 degrees apart in seal assembly (1005/9).

(g) Install seal ring (1005/2) to ring groove on OD of one nut (1005/1) and lubricate nut threads with Engine Oil P03−001. Place nut aside.

(h) Install seal ring (1005/3) to ring groove on OD of two nuts (1005/4) and lubricate nut threads with Engine Oil P03−001. Place nuts aside.

(i) Install chilled duct assembly (1005/8) over seal assembly (1005/9) aligning nine bolt holes and three large bosses. Lightly tap to seat.

NOTE: Do not disturb gaskets (1005/10) and (1005/11) on seal assembly (1005/9) bosses.

(j) Remove two guide pins (1005/12).

(k) Secure cooling duct assembly (1005/8) with nine bolts (1005/5), washers (1005/6) and gaskets (1005/7) fingertight.

(l) Install two previously assembled nuts (1005/4) and seal rings (1005/3), slotted face up to seal assembly (1005/9) handtight.

(m) Install one previously assembled nut (1005/1) and seal ring (1005/2) slotted face up to seal assembly (1005/9) handtight.

(n) Torque nine bolts (1005/5) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(o) (Reference 409) With PWA 85541 Wrench torque two large nuts (1005/4) 850 − 900 lb−in. (96.037 − 101.686 N.m).

(p) (Reference 408) With PWA 85542 Wrench torque one small nut (1005/1) 675 − 725 lb−in. (76.265 − 81.914 N.m).

(q) Install lock (1005/13) over larger nut (1005/4) at two locations. Position lock to align holes in lock with four holes in boss on seal assembly (1005/9).

(r) Install lock (1005/14) over small nut (1005/1) at one location. Position lock to align holes in lock with four holes in boss on seal assembly (1005/9).

(5) Install No. 3 bearing elbow assembly.

(a) Install elbow (1006/7) to seal assembly (1006/9) engaging lug on elbow (1006/7) with clevis on seal assembly (1006/9). Secure with two key washers (1006/6) and two bolts (1006/5) lubricated with Engine Oil P03−001. Do not run down bolts (1006/5). See Figure 1006.

(b) Install heat shield assembly (1006/13) between elbow (1006/7) and seal assembly (1006/9). Position key washer (1006/6) tabs into elbow (1006/7) and secure bolts (1006/5) fingertight.

(c) Secure elbow lug to clevis on seal assembly (1006/9) with bolt (1006/8), lubricated with Engine Oil P03−001, and nut (1006/12).

(d) Torque bolts (1006/5) 75 − 85 lb−in. (8.474 − 9.604 N.m).

(e) Torque nut (1006/12) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Bend tabs on key washers (1006/6) to secure bolts (1006/3), see locking devices, 70−53, Standard Practices Manual, PN 585005.

(g) Install heat shield assembly (1006/4) over elbow (1006/7) aligning slot with elbow lug.

(h) Install shield (1006/3) over heat shield assembly (1006/4) aligning bolt holes. Secure with four key washers (1006/2) and four bolts (1006/1) lubricated with Engine Oil P03−001.

(i) Torque bolts (1006/1) 32 - 36 lb-in. (3.616 - 4.067 N.m).

NOTE: Smaller tab on key washers (1006/2) to be down over edge of shield (1006/3).

(j) Bend tabs of key washers (1006/2) to secure heat shield to seal assembly (1006/9). See locking devices, 70-53, Standard Practices Manual, PN 585005.

(k) Rotate Adapter (PWA 85167) (1006/11) on Bench Fixture (PWA 85199) (1006/10) so seal assembly (1006/9) is large OD up. Remove assembly from adapter and place on bench.

(l) Cover seal assembly with plastic and place in PWA 85057 Storage Stand.

D. Postrequisites

(1) For assembly of diffuser and combustor internals, see Assembly-01 Task 72-41-00-400-001.

Task 72−41−00−400−003:

1. Assemble Fuel Tubes And Fuel Distribution Valve

A. Prerequisites

(1) See 72−41−00, Inspection/Check−04 Task 72−41−00−990−001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble internal parts. See 72−41−00, Assembly−01 Task 72−41−00−400−001.

(3) Assemble No. 3 bearing duct and housing. See 72−41−00, Assembly−02 Task 72−41−00−400−002−001.

B. Equipment And Materials Required

Special Tools:

PWA 85579	Adapter

Consumable Materials:

Item No.	Designation
P03−001	Oil, Engine (PWA 521B)
P05−007	Fluid, Leak Check (PMC 9569 or PMC 2277)
P06−053	Lubricant, Seal Ring (PWA 36500)
P06−021	Compound, Antigalling (PWA 550−3)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Packing	16	73−13−00/3/1
Packing	16	73−13−00/3/530

C. Procedure

Subtask 72−41−00−430−066:

(1) (Reference 2152) Install fuel flow divider bracket and fuel supply tube assemblies as follows. See Figure 1001 and Table 1001.

DIFFUSER AND COMBUSTOR - ASSEMBLY-03

Fuel Tube Assembly Part Number	Tube Function Number	Fuel Injector Number
51T379, 54T328-01 (POST SB 73-127)	(FM01)	2
51T928, 54T334-01 (POST SB 73-127)	(FM02)	5
51T934, 54T336-01 (POST SB 73-127) 58T076-01 (POST SB 73-133)	(FM08)	23
51T930, 54T335-01 (POST SB 73-127)	(FM04)	11
51T387, 53T657-01 54T339-01 (POST SB 73-127)	(FM05)	14
51T389, 53T658-01 54T340-01 (POST SB 73-127)	(FM06)	17
51T932, 53T659-01 54T341-01 (POST SB 73-127)	(FM07)	20
51T383, 54T331-01 (POST SB 73-127)	(FM03)	8

Table 1001

(a) Install two packings (1001/18) lubricated with Engine Oil P03-001 or Seal Ring Lubricant P06-053, to each of eight transfer tubes (1001/2).

(b) Install transfer tubes (1001/2) to eight fuel manifold assemblies (1001/1). Seat transfer tubes in manifold connectors.

(c) Ensure that diffuser case (1001/17) bolt holes No. 38 - 43 are aligned with cut out in PWA 86508 Build Stand or PWA 85044 Build Stand (1001/4).

(d) Install fuel flow divider bracket assembly (1001/3) above diffuser case flange at holes No. 37 - 43. Secure with two work bolts (1001/15) lubricated with Engine Oil P03-001, and two washers (1001/16) and nuts (1001/14).

(2) Remove closures from fuel supply tube assembly (FM01) and blow shop air through assembly to assure the absence of foreign material. See Table 1001 for tube assembly part number and fuel injector location.

(a) Lubricate threads of tube nut (1001/19) with Antigalling Compound P06-021, and install tube assembly (FM01) to fuel injector No. 2 fingertight. Tube to run in a clockwise direction to hole in bracket assembly (1001/3).

(3) Remove closures from tube assembly (FM02) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06-021, and install tube assembly (FM02) to fuel injector No. 5 fingertight. Tube to run in a clockwise direction to bracket (1001/3).

(4) Remove closures from tube assembly (FM08) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06-021, and install tube assembly (FM08) to fuel injector No. 23 fingertight. Tube to run in a clockwise direction to bracket (1001/3).

(5) Remove closures from tube assembly (FM04) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06-021, and install tube assembly (FM04) to fuel injector No. 11 fingertight. Tube to run in a counterclockwise direction to bracket (1001/3).

(6) Remove closures from tube assembly (FM05) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06−021, and install tube assembly (FM05) to fuel injector No. 14 fingertight. Tube to run in a counterclockwise direction to bracket (1001/3).

(7) Remove closures from tube assembly (FM06) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06−021, and install tube assembly (FM06) to fuel injector No. 17 fingertight. Tube to run in a counterclockwise direction to bracket (1001/3).

(8) Remove closures from tube assembly (FM07) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut with Antigalling Compound P06−021, and install tube assembly (FM07) to fuel injector No. 20 fingertight. Tube to run in a counterclockwise direction to bracket (1001/3).

(9) Remove closures from tube assembly (FM03) and blow shop air through assembly to assure the absence of foreign material.

(a) Lubricate threads of tube nut (1001/19) with Antigalling Compound P06−021, and install tube assembly (FM03) to fuel injector No. 8 fingertight. Tube to run in a clockwise direction to bracket (1001/3).

(10) Using nuts (1001/5) lubricated with Antigalling Compound P06−021, secure eight tubes to bracket (1001/3) fingertight. Assure connectors on tube ends are fully engaged in holes in bracket (1001/3).

Subtask 72−41−00−430−067:

(11) Install Flange K brackets and fuel supply tube clamps.

(12) Position bracket (1002/9) over Holes 14 and 15 in diffuser case Flange K (1002/3). See Figure 1002.

(a) Install two clamps (1002/1) to fuel tubes and secure to bracket (1002/9) with bolt (1002/10) lubricated with Engine Oil P03-001, and nut (1002/2). Secure fingertight.

(13) Position bracket (1002/8) over Holes 27 and 28 in Flange K (1002/6).

(a) Install two clamps (1002/5) to fuel tubes and secure to bracket (1002/8) with bolts (1002/4) lubricated with Engine Oil P03-001, and nuts (1002/7). Secure fingertight.

(14) Position bracket (1003/2) over Holes 45 and 44 in Flange K (1003/9). See Figure 1003.

(a) Install four clamps (1003/1) to fuel tubes and secure to bracket (1003/2) with two bolts (1003/3), lubricated with Engine Oil P03-001, and two nuts (1003/10). Secure fingertight.

(15) Position bracket (1003/5) over Holes 53 and 54 in Flange K (1003/7).

(a) (Pre SB PW4ENG 73-86) Install three clamps (1003/4) to fuel tubes and secure to bracket (1003/5) with bolt (1003/6) lubricated with Engine Oil P03-001, and nut (1003/8). Secure fingertight.

(b) (Post SB PW4ENG 73-86) Install two clamps (1003/4) and one clamp (1003/11) to fuel tubes and secure to bracket (1003/5) with bolts (1003/6) lubricated with Engine Oil P03-001, and nuts (1003/8). Secure fingertight.

(16) Position bracket (1004/2) over Holes 65 and 66 in Flange K (1004/4). See Figure 1004.

(a) Install three clamps (1004/1) to fuel tubes and secure to bracket (1004/2) with bolt (1004/3) lubricated with Engine Oil P03-001, and nut (1004/10). Secure fingertight.

(17) Position bracket (1004/8) over Holes 73 and 74 in Flange K (1004/7).

(a) Install two clamps (1004/5) to fuel tubes and secure to bracket (1004/8) with bolt (1004/9) lubricated with Engine Oil P03-001, and nut (1004/6). Secure fingertight.

(18) Position bracket (1005/9) over Holes 80 and 81 in Flange K (1005/8). See Figure 1005.

(a) Install two clamps (1005/1) to fuel tubes and secure to bracket (1005/9) with bolt (1005/10) lubricated with Engine Oil P03-001, and nut (1005/2). Secure fingertight.

(19) Position bracket (1005/7) over Holes 118 and 119 in Flange K (1005/6).

(a) Install clamp (1005/4) to fuel tube and secure to bracket (1005/7) with bolt (1005/3) lubricated with Engine Oil P03-001, and nut (1005/5). Secure fingertight.

(20) Tighten nine nuts, securing clamps to brackets several turns to prevent them from falling off.

NOTE: Clamp nuts will be torqued at engine assembly.

(21) (Reference 2152) Torque eight nuts (1006/3) securing fuel tubes to bracket assembly (1006/5) to 200 - 225 lb-in. (22.597 - 25.422 N.m). See Figure 1006.

NOTE: Hold fuel tube connectors (1006/4) when torquing nuts.

(22) Lockwire eight nuts (1006/3) together in pairs as shown per referenced figure.

NOTE: Tube nuts will be torqued after fuel distribution system leak test has been accomplished.

Subtask 72-41-00-430-056:

(23) (Pre SB PW4ENG 73-170) Install fuel distribution valve and leak test. See Figure 1007.

(a) Place fuel distribution valve (1007/6) on workbench.

(b) Install two packings (1007/3) lubricated with Engine Oil P03-001 or Seal Ring Lubricant P06-053, to each of eight transfer tubes (1007/4).

(c) Install transfer tubes (1007/4) with packings to eight parts on valve (1007/6). Seat transfer tubes in valve.

(d) Install fuel distribution valve (1007/6) to bracket (1007/2) aligning two dowel pins (1007/7) on valve with holes in bracket and transfer tubes with fuel manifolds (1007/1). Secure with four work bolts (1007/9) lubricated with Engine Oil P03-001, and four washers (1007/8) fingertight.

(e) Tighten work bolts (1007/9) equally and evenly to seat transfer tubes (1007/4) in fuel supply tubes (1007/1).

(f) Remove four work bolts (1007/9) and washers (1007/8) one at a time and install bolts lubricated with Engine Oil P03-001, at each hole. Secure fingertight.

NOTE: (Pre SB PW4ENG 73-170) bolts are shorter than (Post SB PW4ENG 73-170) bolts and do not have reliable engagement in the helicoil locking feature. Also these bolts do not have antigallant coated threads which would help to improve disassembly.

(g) (Post SB PW4ENG 73-164) Install the EBU harness bracket (1007/10) to the rear of the bracket (1007/2) at the outer right bolt hole.

(h) Torque four bolts 85 - 95 lb-in. (9.604 - 10.734 N.m).

(24) (Post SB PW4ENG 73-170) Install fuel distribution valve and leak test. See Figure 1007.

(a) Place fuel distribution valve (1007/6) on workbench.

(b) Install two packings (1007/3) lubricated with Engine Oil P03-001 or Seal Ring Lubricant P06-053, to each of eight transfer tubes (1007/4).

(c) Install transfer tubes (1007/4) with packings to eight parts on valve (1007/6). Seat transfer tubes in valve.

(d) Install fuel distribution valve (1007/6) to bracket (1007/2) aligning two dowel pins (1007/7) on valve with holes in bracket and transfer tubes with fuel manifolds (1007/1). Secure with four (not lubricated) work bolts (1007/9) and four washers (1007/8) fingertight.

(e) Tighten work bolts (1007/9) equally and evenly to seat transfer tubes (1007/4) in fuel supply tubes (1007/1).

(f) Remove four work bolts (1007/9) and washers (1007/8) one at a time and install bolts at each hole. Secure fingertight.

NOTE: (Post SB PW4ENG 73−170) bolts are longer than (Pre SB PW4ENG 73−170) bolts for improved engagement in the helicoil locking feature. Also these bolts have antigallant coated threads for improved disassembly.

(g) (Post SB PW4ENG 73−164) Install the EBU harness bracket (1007/10) to the rear of the bracket (1007/2) at the outer right bolt hole.

(h) Torque four bolts 62 − 72 lb−in. (7.005 − 8.135 N.m).

(25) Connect PWA 85579 Adapter (1007/5) to fuel distribution valve (1007/6).

(a) Supply filtered air through PWA 85579 Adapter at 95 − 105 psig (655.0 − 723.9 kPa) and check for visible leaks from any surface, joint or connection in the manifold system. Use Leak Check Fluid P05−007 for a minimum of five minutes. Make sure air is flowing from all 24 nozzles.

NOTE: Be sure that all the manifold and tube nuts are loose enough to find a leak in the transfer tube packings.

R NOTE: During pressure test, make sure that the
R leak check fluid is applied to the fuel
R nozzle inlet fitting braze joint and do an
R inspection for all the signs of leakage.
R See Figure 1008.

(b) If leakage is present repair or replace parts as required and repeat leak test.

(c) If no leakage is present reduce pressure and remove PWA 85579 Adapter (1007/5).

(26) Using suitable protective closure, cover end of fuel distribution valve (1007/6) and wrap in plastic secured with tape.

(27) Torque the 24 manifold assembly tube nuts (1008/1) and the eight fuel supply tube nuts (1008/2) as follows:

(a) (Reference 2152) Torque the fuel supply tube nuts (8 places) to 275 - 325 lb-in. (31.071 - 36.720 N.m).

(b) (Reference 2152) Torque the manifold nuts on the fuel injectors (24 places) to 185 - 200 lb-in. (20.902 - 22.597 N.m).

(28) Lockwire (1008/3) the fuel manifold nut (1008/1) to the fuel supply tube nut (1008/2) at fuel nozzle locations No. 2, 5, 8, 11, 14, 17, 20 and 23. See Figure 1008.

(29) Lockwire (1008/5) remaining fuel manifold nuts (1008/6) to lower bolt (1008/4) at fuel injector locations No. 1, 3, 4, 6, 7, 9, 10, 12, 13, 15, 16, 18, 19, 21, 22 and 24. See Figure 1008.

(30) Remove two work bolts (1001/15), washers (1001/16) and nuts (1001/14) securing fuel flow divider bracket (1001/3) to diffuser case.

(31) Remove tape locating fuel injector locations from diffuser case.

(32) Ensure there is a protective cover over No. 3 bearing outer race.

(33) Cover all open ports, tubes and fittings with plastic closures and cover entire assembly with plastic bag.

Fuel Manifold And Tube Lockwire Procedure
Figure 1008
(Task 72–41–00–400–003)

Task 72-41-00-400-002-002:

1. Assemble No. 3 Bearing Duct And Housing Including Bearing Outer Race - (Mechanical Wrench Method)

NOTE: To assemble No. 3 bearing duct and housing by means of hydraulic wrench method, see Assembly-02 Task 72-41-00-400-002-001.

NOTE: For alternate procedure not requiring installation of No. 3 bearing outer race, outer race installed after diffuser combustor group is installed into HPC, see Assembly-05 Task 72-41-00-400-004.

A. Prerequisites

(1) See Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 29754	Control
PWA 29855-3	Pin
PWA 29855-5	Pin (Two Required)
PWA 45418	Wrench, Mechanical*
PWA 45419	Multiplier, Pneumatic*
PWA 80071	Multiplier, Torque*
PWA 80187	Wrench, Mechanical*
PWA 80651	Multiplier, Pneumatic*
PWA 85048	Base
PWA 85049	Drift
PWA 85053	Wrench, Torque*
PWA 85054	Adapter, Holding*
PWA 85056	Cover (Optional To PWA 85802)
PWA 85057	Storage Stand
PWA 85167	Adapter
PWA 85199	Fixture
PWA 85375	Plate, Anchor*
PWA 85541	Wrench
PWA 85542	Wrench
PWA 85679	Heater (Optional To PWA 85795)

PWA 85901	Riveter
PWA 86546	Adapter (Optional To PWA 85199)

DIFFUSER AND COMBUSTOR - ASSEMBLY-04

Special Tools:

(CONTINUED)

PWA 88100	Plate, Anchor*

*Refer to Table 1001 for tool options. Only Table 1001 shows the correct combinations of tools for the installation of the No. 3 bearing (outer race) retaining nut.

NOTE: The PWA 86546 Adapter is an optional tool that will permit PWA 85167 Adapter to be mounted to an approved bench positioner when the electric motorized PWA 85199 Fixture is not available.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-026	Ink (Marking) (PMC 4057-1)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	2	72-41-00/9/10
Gasket	1	72-41-00/9/5
Gasket	1	72-41-00/10/160
Gasket	9	72-41-00/9/160
Key Washer	2	72-41-00/10/80
Key Washer	4	72-41-00/10/10
Key Washer	3	72-41-00/10/140
Rivet	1	72-41-00/12/40
Seal Ring	1	72-41-00/9/185
Seal Ring	2	72-41-00/9/195

C. Procedure

Subtask 72-41-00-430-071:

(1) Install No. 3 bearing outer race. See Figure 1001.

(a) Using hoist, place PWA 85048 Base (1001/3) on bench. Remove base lifting eye and screw into storage hole on OD of base.

(b) Install No. 3 bearing housing (1001/2), threaded ID up, aligning four pins in PWA 85048 Base (1001/3) with bolt holes in housing (1001/2).

(c) Locate two dimples on top surface (1001/6) of No. 3 bearing housing (1001/2) threaded ID. Mark a line between the dimples using Ink P05−026.

(d) Install PWA 85679 or PWA 85795 Heater (1001/7) to rear flange of housing (1001/2). Connect power and thermocouple cables to PWA 29754 Control or equivalent (1001/1).

(e) Set heater (1001/7) to 300°F (149°C) and heat housing (1001/2) for fifty five to sixty minutes.

(f) Wearing clean gloves, place No. 3 bearing assembly on clean waxed paper on bench.

(g) Separate outer race (1001/4) from inner race and rollers (1001/5) and place them, serial number up on bench.

(h) Verify bearing inner and outer race serial numbers are the same.

(i) Place bearing inner race and rollers (1001/5) in sealed container and retain with diffuser case for future installation.

(j) Turn off heater (1001/7). Disconnect control (1001/1) and remove heater (1001/7) from housing (1001/2).

(k) Install No. 3 bearing outer race (1002/2) into housing (1002/3) with serial number up and aligning "X" on outer race (1002/2) with ink mark (1002/4) on housing (1002/3). See Figure 1002.

(l) With PWA 85049 Drift (1002/1) and standard arbor press, drift outer race (1002/2) into housing (1002/3) and seat.

(m) Using feeler gage verify outer race (1002/2) is seated in housing (1002/3).

DIFFUSER AND COMBUSTOR − ASSEMBLY−04

CAUTION: A NEW OR RE−SILVER PLATED NO. 3 BEARING (OUTER RACE) RETAINING NUT MUST BE INSTALLED AT EACH INSTALLATION OR DAMAGE TO MATING PARTS MAY OCCUR. NUT MAY BE RE−SILVER PLATED BY 72−41−83, REPAIR−01 PW4000 Series CIR, PN 51A357.

(2) Install the No. 3 bearing (outer race) retaining nut as follows. Refer to Table 1001 for the correct combinations of tools. Refer to Figure 1003.

PWA Hand Wrench or Torque Wrench	PWA Wrench Adapter or Holding Adapter	PWA Mechanical Wrench or Torque Multiplier	PWA Pneumatic Multiplier	PWA Plate Holder or Anchor Plate
85053	85054	80187	80651 or 45419	88100 or 85375
85053	85054	45418	45419	88100 or 85375
85053	85054	80071	80651 or 45419	88100

Matrix Of Tools Used To Install The
No. 3 Bearing (Outer Race) Retaining Nut
Table 1001

(a) Lubricate No. 3 bearing (outer race) retaining nut (1003/8) with Engine Oil P03−001. See Figure 1003.

(b) Install retaining nut (1003/8) in housing (1003/6) with slots up. Handtighten.

(c) Install PWA 85054 Wrench Adapter (1003/9), spline end up over the pilot of PWA 85048 Base (1003/5) and rotate to engage the four slots with the four keys of the base (1003/5).

(d) Install PWA 85053 Torque Wrench (1003/10) over PWA 85054 Wrench Adapter (1003/9) engaging the slots on the outer race retaining nut (1003/8).

(e) Install a mechanical wrench onto the torque wrench.

DIFFUSER AND COMBUSTOR − ASSEMBLY−04

CAUTION: PWA 80651 MULTIPLIER MUST NOT BE USED WITH PWA 45418 WRENCH OR DAMAGE TO WRENCH CAN OCCUR.

(f) Install an anchor plate (1003/1) over the adapter and engage the splines. Align and engage the two holes in the anchor plate with the two pins of the mechanical wrench. Wrenches can be actuated by use of a pneumatic multiplier.

CAUTION: TO AVOID INCORRECT TORQUE READING, RETAINING NUT (1003/6) MUST NOT BE TORQUED UNTIL NO. 3 BEARING HOUSING (1003/3) HAS RETURNED TO ROOM TEMPERATURE. SHOP AIR MAY BE USED FOR COOLING. DO NOT USE DRY ICE.

CAUTION: NO. 3 BEARING (OUTER RACE) RETAINING NUT MUST BE RE−SILVER PLATED AFTER TORQUING NUT A MAXIMUM OF THREE TIMES FOR EACH INSTALLATION PRIOR TO ENGINE BEING OPERATED. NUT MAY BE RE−SILVER PLATED BY 72−41−83, REPAIR−01 PW4000 Series CIR, PN 51A357.

(g) (Reference 975) Torque retaining nut (1003/6) to 3600 − 4400 lb−in. (406.745 − 497.133 N.m). Turn through angle of 16° − 17° 30'. Loosen to 0 lb−in. (0 N.m) then repeat torque sequence, aligning one rivet hole in retaining nut (1003/8) with one rivet hole in housing (1003/6).

(h) Remove the tools from the nut.

(i) Install rivet (1003/7) into aligned holes in housing (1003/6) and retaining nut (1003/8) and with PWA 85901 Hand Riveter, flare rivet (1003/7) to secure. See Chapter/Section 70−43, Standard Practices Manual, PN 585005.

(j) Remove housing assembly (1003/6) from base (1003/5) and place on clean paper, on bench large OD up.

(k) Position PWA 85802 or PWA 85056 Protective Cover (1003/4) over retaining nut (1003/8) installed in housing (1003/6). If PWA 85056 Protective Cover is used, slowly rotate cover until the three spring plungers seat in holes in retaining nut.

Subtask 72−41−00−430−072:

(3) Assemble No. 3 bearing front (carbon) seal assembly and housing and outer race. See Figure 1004.

(a) Install No. 3 bearing housing and outer race (1004/7) small ID down into PWA 85167 Adapter (1004/6) mounted on PWA 85199 Bench Fixture (1004/4). Secure housing (1004/7) with six bolts (1004/12) wrench tight.

(b) Rotate housing (1004/7) and adapter (1004/6) so small OD is facing up.

(c) Place No. 3 bearing front (carbon) seal assembly (1004/1) on bench large OD up. Locate three hole pad inside seal assembly (1004/1).

(d) Install No. 3 bearing nozzle assembly (1004/11) small nozzle toward carbon seal. Secure fingertight with three key washers (1004/9) and bolts (1004/10) lubricated with Engine Oil P03−001.

(e) Torque bolts (1004/10) 65 − 85 lb−in. (7.344 − 9.604 N.m).

(f) Bend tabs on key washers (1004/9) to secure bolts (1004/10), see locking devices 70−53, Standard Practices Manual, PN 585005.

(g) Install gasket (1004/2) to inner flange on bearing housing (1004/7).

(h) Install two PWA 29855−3 Guide Pins (1004/8) 180 degrees apart to seal assembly (1004/1) flange.

(i) Install seal assembly (1004/1) to housing (1004/7) aligning offset holes. Secure with eight work bolts (1004/3) lubricated with Engine Oil P03−001, placed on each side of four countersunk screw holes fingertight. Rotate seal assembly and housing large OD up and tighten work bolts in a 180 degrees pattern until seal assembly is fully seated against housing. Ensure all bolt holes are aligned.

(j) Remove guide pins (1004/8).

(k) Install four screws (1004/5) lubricated with Engine Oil P03−001, to countersunk holes in housing (1004/7).

(l) Torque screws (1004/5) 22 − 85 lb−in. (2.486 − 9.604 N.m) loosen and retorque 22 − 85 lb−in. (2.486 − 9.604 N.m).

(m) Remove eight work bolts (1004/3) from flange.

Subtask 72−41−00−430−073:

(4) Assemble No. 3 bearing front cooling duct assembly and No. 3 bearing seal assembly and housing. See Figure 1005.

(a) Rotate seal assembly and housing large OD down.

(b) Chill No. 3 bearing front cooling duct assembly (1005/8) for five to ten minutes.

(c) Install nine gaskets (1005/7) to nine washers (1005/6), lightly waxed in place with Beeswax P05−395 or Paraffin Wax Blend P05−396. Lubricate nine bolts (1005/5) with Engine Oil P03−001.

(d) Install two large gaskets (1005/11) to bosses on seal assembly (1005/9), below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(e) Install one small gasket (1005/10) to boss on seal housing (1005/9) below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(f) Install two PWA 29855−5 Guide Pins (1005/12) 180 degrees apart in seal assembly (1005/9).

(g) Install seal ring (1005/2) to ring groove on OD of one nut (1005/1) and lubricate nut threads with Engine Oil P03−001. Place nut aside.

(h) Install seal ring (1005/3) to ring groove on OD of two nuts (1005/4) and lubricate nut threads with Engine Oil P03−001. Place nuts aside.

(i) Install chilled duct assembly (1005/8) over seal assembly (1005/9) aligning nine bolt holes and three large bosses. Lightly tap to seat.

NOTE: Do not disturb gaskets (1005/10) and (1005/11) on seal assembly (1005/9) bosses.

(j) Remove two guide pins (1005/12).

(k) Secure cooling duct assembly (1005/8) with nine bolts (1005/5), washers (1005/6) and gaskets (1005/7) fingertight.

(l) Install two previously assembled nuts (1005/4) and seal rings (1005/3), slotted face up to seal assembly (1005/9) handtight.

(m) Install one previously assembled nut (1005/1) and seal ring (1005/2) slotted face up to seal assembly (1005/9) handtight.

(n) Torque nine bolts (1005/5) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(o) (Reference 409) With PWA 85541 Wrench torque two large nuts (1005/4) 850 − 900 lb−in. (96.037 − 101.686 N.m).

(p) (Reference 408) With PWA 85542 Wrench torque one small nut (1005/1) 675 − 725 lb−in. (76.265 − 81.914 N.m).

(q) Install lock (1005/13) over larger nut (1005/4) at two locations. Position lock to align holes in lock with four holes in boss on seal assembly (1005/9).

(r) Install lock (1005/14) over small nut (1005/1) at one location. Position lock to align holes in lock with four holes in boss on seal assembly (1005/9).

(5) Install No. 3 bearing elbow assembly.

(a) Install elbow (1006/7) to seal assembly (1006/9) engaging lug on elbow (1006/7) with clevis on seal assembly (1006/9). Secure with two key washers (1006/6) and two bolts (1006/5) lubricated with Engine Oil P03−001. Do not run down bolts (1006/5). See Figure 1006.

(b) Install heat shield assembly (1006/13) between elbow (1006/7) and seal assembly (1006/9). Position key washer (1006/6) tabs into elbow (1006/7) and secure bolts (1006/5) fingertight.

(c) Secure elbow lug to clevis on seal assembly (1006/9) with bolt (1006/8), lubricated with Engine Oil P03−001, and nut (1006/12).

(d) Torque bolts (1006/5) 75 − 85 lb−in. (8.474 − 9.604 N.m).

(e) Torque nut (1006/12) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Bend tabs on key washers (1006/6) to secure bolts (1006/3), see locking devices, 70−53, Standard Practices Manual, PN 585005.

(g) Install heat shield assembly (1006/4) over elbow (1006/7) aligning slot with elbow lug.

(h) Install shield (1006/3) over heat shield assembly (1006/4) aligning bolt holes. Secure with four key washers (1006/2) and four bolts (1006/1) lubricated with Engine Oil P03−001.

(i) Torque bolts (1006/1) 32 − 36 lb−in. (3.616 − 4.067 N.m).

NOTE: Smaller tab on key washers (1006/2) to be down over edge of shield (1006/3).

(j) Bend tabs of key washers (1006/2) to secure heat shield to seal assembly (1006/9). See locking devices, 70−53, Standard Practices Manual, PN 585005.

(k) Rotate Adapter (PWA 85167) (1006/11) on Bench Fixture (PWA 85199) (1006/10) so seal assembly (1006/9) is large OD up. Remove assembly from adapter and place on bench.

(l) Cover seal assembly with plastic and place in PWA 85057 Storage Stand.

D. Postrequisites

No. 3 Bearing Elbow Assembly Installation
Figure 1006
(Task 72-41-00-400-002-002)

Task 72-41-00-400-004:

1. Assemble No. 3 Bearing Duct And Housing - Procedure Not Requiring No. 3 Bearing Outer Race Installation

NOTE: For alternate procedure utilizing installation of No. 3 bearing outer race into diffuser combustor group before being installed onto HPC, See Assembly-02 Task 72-41-00-400-002-001 or Assembly-04 Task 72-41-00-400-002-002.

A. Prerequisites

(1) See Inspection/Check-04 Task 72-41-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a referenced number. For example: (Reference 1234) Torque retaining nut as follows.

B. Equipment And Materials Required

Special Tools:

PWA 29855-3	Pin
PWA 29855-5	Pin (Two Required)
PWA 85057	Storage Stand
PWA 85167	Adapter
PWA 85199	Fixture
PWA 85541	Wrench
PWA 85542	Wrench
PWA 86546	Adapter (Optional To PWA 85199)

NOTE: The PWA 86546 Adapter is an optional tool that will permit PWA 85167 Adapter to be mounted to an approved bench positioner when the electric motorized PWA 85199 Fixture is not available.

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

DIFFUSER AND COMBUSTOR − ASSEMBLY−05

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Gasket	2	72−41−00/9/10
Gasket	1	72−41−00/9/5
Gasket	1	72−41−00/10/160
Gasket	9	72−41−00/9/160
Key Washer	2	72−41−00/10/80

Seal Ring	1	72−41−00/9/185
Seal Ring	2	72−41−00/9/195

C. Procedure

Subtask 72−41−00−430−074:

(1) Assemble No. 3 bearing front (carbon) seal assembly and housing. See Figure 1001.

(a) Install No. 3 bearing housing, (1001/7) small ID down into PWA 85167 Adapter (1001/6) mounted on PWA 85199 Bench Fixture (1001/4). Secure housing (1001/7) with six bolts (1001/12) wrench tight.

(b) Rotate housing (1001/7) and adapter (1004/6) so small OD is facing up.

(c) Place No. 3 bearing front (carbon) seal assembly (1001/1) on bench large OD up. Locate three hole pad inside seal assembly (1001/1).

(d) Install No. 3 bearing nozzle assembly (1001/11) small nozzle toward carbon seal. Secure fingertight with three key washers (1001/9) and bolts (1001/10) lubricated with Engine Oil P03−001.

(e) Torque bolts (1001/10) 65 − 85 lb−in. (7.344 − 9.604 N.m).

(f) Bend tabs on key washers (1001/9) to secure bolts (1001/10), see locking devices 70−53, Standard Practices Manual, PN 585005.

(g) Install gasket (1001/2) to inner flange on bearing housing (1001/7).

(h) Install two PWA 29855−3 Guide Pins (1001/8) 180 degrees apart to seal assembly (1001/1) flange.

(i) Install seal assembly (1001/1) to housing (1001/7) aligning offset holes. Secure with eight work bolts (1001/3) lubricated with Engine Oil P03−001, placed on each side of four countersunk screw holes fingertight. Rotate seal assembly and housing large OD up and tighten work bolts in a 180 degrees pattern until seal assembly is fully seated against housing. Ensure all bolt holes are aligned.

(j) Remove guide pins (1001/8).

(k) Install four screws (1001/5) lubricated with Engine Oil P03−001, to countersunk holes in housing (1001/7).

(l) Torque screws (1001/5) 22 − 85 lb−in. (2.486 − 9.604 N.m) loosen and retorque 22 − 85 lb−in. (2.486 − 9.604 N.m).

(m) Remove eight work bolts (1001/3) from flange.

Subtask 72−41−00−430−075:

(2) Assemble No. 3 bearing front cooling duct assembly and No. 3 bearing seal assembly and housing. See Figure 1002.

(a) Rotate seal assembly and housing large OD down.

(b) Chill No. 3 bearing front cooling duct assembly (1002/8) for five to ten minutes.

(c) Install nine gaskets (1002/7) to nine washers (1002/6), lightly waxed in place with Beeswax P05−395 or Paraffin Wax Blend P05−396. Lubricate nine bolts (1002/5) with Engine Oil P03−001.

(d) Install two large gaskets (1002/11) to bosses on seal assembly (1002/9), below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(e) Install one small gasket (1002/10) to boss on seal housing (1002/9) below threaded portion. Lightly wax in place with Beeswax P05−395 or Paraffin Wax Blend P05−396.

(f) Install two PWA 29855−5 Guide Pins (1002/12) 180 degrees apart in seal assembly (1002/9).

(g) Install seal ring (1002/2) to ring groove on OD of one nut (1002/1) and lubricate nut threads with Engine Oil P03−001. Place nut aside.

(h) Install seal ring (1002/3) to ring groove on OD of two nuts (1002/4) and lubricate nut threads with Engine Oil P03−001. Place nuts aside.

(i) Install chilled duct assembly (1002/8) over seal assembly (1002/9) aligning nine bolt holes and three large bosses. Lightly tap to seat.

NOTE: Do not disturb gaskets (1002/10) and (1002/11) on seal assembly (1002/9) bosses.

(j) Remove two guide pins (1002/12).

(k) Secure cooling duct assembly (1002/8) with nine bolts (1002/5), washers (1002/6) and gaskets (1002/7) fingertight.

(l) Install two previously assembled nuts (1002/4) and seal rings (1002/3), slotted face up to seal assembly (1002/9) handtight.

(m) Install one previously assembled nut (1002/1) and seal ring (1002/2) slotted face up to seal assembly (1002/9) handtight.

(n) Torque nine bolts (1002/5) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(o) (Reference 409) Using PWA 85541 Wrench torque two large nuts (1002/4) 850 − 900 lb−in. (96.037 − 101.686 N.m).

(p) (Reference 408) Using PWA 85542 Wrench torque one small nut (1002/1) 675 − 725 lb−in. (76.265 − 81.914 N.m).

(q) Install lock (1002/13) over larger nut (1002/4) at two locations. Position lock to align holes in lock with four holes in boss on seal assembly (1002/9).

(r) Install lock (1002/14) over small nut (1002/1) at one location. Position lock to align holes in lock with four holes in boss on seal assembly (1002/9).

(3) Install No. 3 bearing elbow assembly. See Figure 1003.

(a) Install elbow (1003/7) to seal assembly (1003/9) engaging lug on elbow (1003/7) with clevis on seal assembly (1003/9). Secure with two key washers (1003/6) and two bolts (1003/5) lubricated with Engine Oil P03−001. Do not run down bolts (1003/5). See Figure 1003.

(b) Install heat shield assembly (1003/13) between elbow (1003/7) and seal assembly (1003/9). Position key washer (1003/6) tabs into elbow (1003/7) and secure bolts (1003/5) fingertight.

(c) Secure elbow lug to clevis on seal assembly (1003/9) with bolt (1003/8), lubricated with Engine Oil P03−001, and nut (1003/12).

(d) Torque bolts (1003/5) 75 − 85 lb−in. (8.474 − 9.604 N.m).

(e) Torque nut (1003/12) 85 − 95 lb−in. (9.604 − 10.734 N.m).

(f) Bend tabs on key washers (1003/6) to secure bolts (1003/3), see locking devices, 70−53, Standard Practices Manual, PN 585005.

(g) Install heat shield assembly (1003/4) over elbow (1003/7) aligning slot with elbow lug.

(h) Install shield (1003/3) over heat shield assembly (1003/4) aligning bolt holes. Secure with four key washers (1003/2) and four bolts (1003/1) lubricated with Engine Oil P03−001.

(i) Torque bolts (1003/1) 32 - 36 lb-in. (3.616 - 4.067 N.m).

NOTE: Smaller tab on key washers (1003/2) to be down over edge of shield (1003/3).

(j) Bend tabs of key washers (1003/2) to secure heat shield to seal assembly (1003/9). See locking devices, 70-53, Standard Practices Manual, PN 585005.

(k) Rotate Adapter (PWA 85167) (1003/11) on Bench Fixture (PWA 85199) (1003/10) so seal assembly (1003/9) is large OD up. Remove assembly from adapter and place on bench.

(l) Cover seal assembly with plastic and place in PWA 85057 Storage Stand.

D. Postrequisites

(1) See Assembly-01 Task 72-41-00-400-001 for assembly of diffuser and combustor internals.

PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Diffuser And Combustor

List of Effective Pages - Diffuser And Combustor
See end of list.

NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY - DISASSEMBLY-01

Task 72-41-07-040-001:

1. Disassemble No. 3 Bearing Front (Carbon) Seal Assembly

   A. Equipment And Materials Required

      Special Tools:
      PWA 85169 Protector, Plastic

   B. Procedure

      See Figure 501.

      (1) Position seal ring holder assembly (501/2) on bench, small diameter down.

      (2) Put PWA 85169 Protector over seal assembly (501/3) which will give protection to the carbon seal while disassembling part.

      (3) Push down on protector and seal assembly (501/3) against the springs (501/1).

      (4) Remove cotter pins (501/4), collars (501/5) and spacers (501/8).

      (5) Remove seal assembly (501/3), springs (501/1) and seal ring (501/9).

      (6) Remove bolt washer (501/6) and strainer (501/7).

NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

Task 72-41-07-440-001:

1. Assemble No. 3 Bearing Front (Carton) Seal Assembly

A. Equipment And Materials

Special Tools:
PWA 85169 Protector

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (P03-001)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Key Washer	5	72-41-00	9	70
Cotter Pin	4	72-41-00	9	150

B. Procedure

See Figures 1001, 1002 and 1003.

(1) Place seal ring holder assembly on bench, smaller diameter down.

(2) Install strainer in seal ring holder assembly with five key washers and bolts lubricated with Engine Oil (P03-001). Torque the bolts to 32 - 36 lb-in. (3.616 - 4.067 N.m). Bend the tabs of the key washers.

(3) Install seal ring in groove of seal ring holder.

NOTE: The strainer center bolt is located on the assembly vertical centerline.

(4) Install springs in spring housings and sleeve spacers over pins in the seal ring holder assembly.

NOTE: The sleeve spacers are located at 3 and 9 o'clock in the seal ring holder assembly.

If you have much wear on the flat sides of the sleeve spacers, you can install the sleeve spacers with the wear towards the support. See Figure 1002.

NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

(5) Install carbon face seal, aligning spring guides and spacers.

(6) Place PWA 85169 Protector over the carbon seal face assembly.

(7) Depress protector and carbon seal face assembly below holes in pins. Install collars and cotter pins. Bend cotter pins.

(8) Remove PWA 85169 Protector.

C. Postrequisites

(1) Do leak check on the No. 3 bearing front (carbon) seal assembly. See Testing-01 (Task 72-41-07-790-001).

Inspect	Serviceable Limits
1. Sleeve Spacer For Wear	Examine the flat sides of the sleeve spacer with a hand held stylus tool. See Figure 1003. Hold the stylus loosely at a 30 degree angle to the wear surface. Guide the stylus perpendicular to the lay of the wear. Only use the weight of the stylus, do not force the stylus with your fingers. If the stylus catches on the wear, you must install the sleeve spacer with the wear towards the support, (away from the flange).

NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY - TESTING-01

Task 72-41-07-790-001:

1. Leak Check No. 3 Bearing Front (Carbon) Seal Assembly

A. Equipment And Materials Necessary

Special Tools:

PWA 6507	Flowmeter, Leak Test
PWA 45411	Gage, Differential
PWA 46400	Gage, Measurement (Air Flow)
PWA 85038	Fixture

Consumable Materials:

Item No.	Designation
P06-002	Petrolatum, White (PMC 9609)

B. Procedure
See Figure 1301 and Figure 1302.

(1) Remove cover from PWA 85038 Fixture and inspect rubber seals on fixture, apply Petrolatum White P06-002 as required.

(2) Remove and inspect the ring assembly (1301/4) for nicks and scratches in the micro finish surface.

(3) Install the ring assembly (1301/4) with the micro finish surface up.

NOTE: Engine bill of material seal seat can be used as an alternative to the ring assembly.

(4) Remove the three cap screws and remove the clamp (1301/5) from the fixture base.

(5) Remove the three aluminum plugs stored in the fixture base.

(6) Carefully lower the seal support assembly (1302/3) into the fixture. Seat the carbon seal assembly (1302/2), Surface B (1302/1) on the fixture ring assembly (1301/4) and the seal support flange against the fixture base.

NO. 3 BEARING FRONT (CARBON) SEAL ASSEMBLY − TESTING−01

(7) Install the detail clamp (1301/5) by indexing it to fit over the outside contour of the seal support assembly (1302/3). The clamp (1301/5) must be correctly positioned to fit over the offset clinch nut on the seal support assembly (1302/3).

(8) Attach the detail clamp (1301/5) to the fixture base with the three cap screws.

(9) Install the three aluminum plugs into the oil pressure, oil scavenge and breather port in the seal support assembly (1302/3).

(10) Install the cover and attach with the large center flange nut and eight cap screws and washers.

(11) Connect the hose marked RETURN from the PWA 46400 Gage to the quick disconnect fitting marked FLOWMETER (1301/3) on the fixture.

(12) If applicable, transfer the quick disconnect socket plugs from the fittings marked INLET−SEALS (1301/2) and DELTA P−SEALS (1301/7) to the fittings marked INLET−PINS (1301/1) and DELTA P−PINS (1301/6), respectively.

(13) Connect the hose marked SUPPLY from the PWA 46400 Gage to the fitting marked INLET−SEAL (1301/2) on the fixture.

(14) Connect the hose marked D. P. LOW from the PWA 46400 Gage to the tee fitting marked DELTA P (1301/7).

(15) As an alternate to PWA 46400 Gage you may use PWA 6507 Flowmeter and PWA 45411 Gage to connect the flowmeter and gage to the fixture as follows:

(a) Connect hose from PWA 6507 Flowmeter to larger of two quick−disconnect fittings marked FLOWMETER (1301/3) attached to fixture base.

(b) Attach smaller fitting of PWA 45411 Gage to the remaining fitting on fixture base.

(c) Attach air inlet hose to fitting marked INLET PINS (1301/1) on the cover.

(d) Attach the larger quick−disconnect fitting on the gage to the remaining quick−disconnect fitting on the fixture cover.

(16) Control air pressure to the fixture slowly to 80 psi (551.6 kPa) and permit to stabilize five minutes.

NOTE: Although 80 psi (551.6 kPA) is the recommended air pressure, it is permitted for the air pressure to be 50 psi (344.7 kPa).

(17) Observe leakage on flowmeter. Total leakage must not be greater than 4.5 CFM (0.13 cu m/min.).

NOTE: If the pressure was at 50 psi (344.7 kPa), the total leakage must not be more than 2.8 CFM (0.08 cu m/min).

(18) If leakage exceeds limits, corrective action must be taken as follows:

(a) Replace seal ring (1302/4), if necessary.

(b) Lap face of carbon seal (1302/1). Refer to the PW4000 Series CIR, PN 51A357, 72−41−09, Repair−04 (Task 72−41−09−300−004).

(c) Repair piston ring groove. Refer to the PW4000 Series CIR, PN 51A357, 72−41−08, Repair−04 (Task 72−41−08−300−004).

OUTER COMBUSTION CHAMBER ASSEMBLY − DISASSEMBLY−01

Task 72−41−11−040−001:

1. Disassemble The Outer Combustion Chamber Assembly (Talon II Low Emission Burner)

   A. Prerequisites

      (1) Remove the outer combustion chamber assembly from the diffuser and combustor by 72−41−00, Disassembly−02 (Task 72−41−00−030−005).

   B. Procedure

      NOTE: It is necessary to remove the liner segments that are installed closest to the combustion chamber mount lugs first and then work rearward.

      (1) Remove the liner segments from the outer combustion chamber assembly as follows. See Figure 501.

         (a) Loosen and remove the nuts (501/2) and washers (501/3) and (501/4) as necessary for each liner segment. Discard all the nuts and damaged washers.

         (b) Carefully remove each liner segment (501/1), (501/5), (501/6), (501/7), (501/8), (501/9), (501/10), (501/11) and (501/12) from the outer combustion chamber.

OUTER COMBUSTION CHAMBER ASSEMBLY - ASSEMBLY-01

Task 72-41-11-440-001:

1. Assemble The Outer Combustion Chamber Assembly (Talon II Low Emission Burner)

R A. Equipment And Materials Necessary - None

B. Procedure
See Figure 1001.

R CAUTION: DO NOT USE ANY LUBRICATION ON THE THREADS.

(1) Install the liner segments to the rearmost outer combustion chamber location as follows.

R NOTE: Installation of the liner segments must begin at the rearmost combustion chamber location (as viewed from the combustion chamber mount lugs) and continue forward.

R (a) Install the liner segment (1001/12) to the rearmost combustion chamber location while you align the hole in the segment with the borescope hole in the chamber.

1 Attach the segment to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2).

2 Install seven washers (1001/4), with the washer dimple in the slot of the chamber wall, and seven nuts (1001/2) to the remaining studs of the liner segment.

R (b) Install the eleven liner segments (1001/1) to the remaining areas of the rearmost combustion chamber locations.

1 Attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner installed.

2 Install seven washers (1001/4), with the washer dimple in the slot of the chamber wall, and seven nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 - 35 lb-in.
R (2.825 - 3.954 N.m).

(2) Install the liner segments to the 2nd rearmost outer combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/9) to the combustion chamber and attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner segment installed.

R (b) Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

(3) Install the liner segments to the 3rd rearmost outer combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/7) to the combustion chamber and attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner segment installed.

R (b) Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

(4) Install the liner segments to the 4th rearmost outer combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/6) to the combustion chamber and attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner segment installed.

R (b) Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in. (2.825 − 3.954 N.m).

(5) Install the liner segments to the 5th rearmost outer combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/5) to the combustion chamber and attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner segment installed.

R (b) Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in. (2.825 − 3.954 N.m).

(6) Install the liner segments to the 6th rearmost outer combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/10) to the combustion chamber and attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner segment installed.

R (b) Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in. (2.825 − 3.954 N.m).

(7) Install the liner segments to the last remaining (closest to the chamber mount lugs) combustion chamber location as follows.

R (a) Install the liner segment (1001/8) to the most forward combustion chamber location while you align the holes in the segment with the holes in the chamber.

1 Attach the segment to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2).

2 Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of the liner segment.

R (b) Install the eleven liner segments (1001/11) to the remaining areas of the most forward combustion chamber locations.

1 Attach the segments to the chamber with one washer (1001/3), at the center stud location, and one nut (1001/2) for each liner installed.

2 Install washers (1001/4), with the washer dimple in the slot of the chamber wall, and nuts (1001/2) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY - DISASSEMBLY-01

Task 72-41-85-040-001:

1. Disassemble No. 3 Bearing Rear (Carbon) Seal Assembly

A. Equipment And Materials Required

Special Tools:
PWA 85169 Protector, Plastic

B. Procedure

See Figure 501.

(1) Position seal ring holder assembly (501/5) on bench, small diameter down.

(2) Put PWA 85169 Protector over seal face (501/4) which will give protection to the carbon seal while disassembling part.

(3) Push down on protector and seal face (501/4) against the springs (501/6).

(4) Remove cotter pins (501/2), collars (501/1), and spacers (501/3).

(5) Remove seal face (501/4), springs (501/6), and seal ring (501/7).

NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY - ASSEMBLY-01

Task 72-41-85-440-001:

1. Assemble No. 3 Bearing Rear (Carbon) Seal Assembly

A. Equipment And Materials Required

Special Tools:
PWA 85169 Protector

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION	FIGURE	ITEM
Cotter Pin	4	72-41-00	12	180

B. Procedure

See Figures 1001, 1002 and 1003.

(1) Place seal ring holder assembly smaller diameter down.

(2) Install seal ring in groove of seal ring holder assembly. Be sure gap in seal ring is installed as shown in Figure 1002 (Sheet 1).

(3) Install springs in spring housings and sleeve spacers over pins in the seal ring holder assembly.

NOTE: The sleeve spacers are located at 3 and 9 o'clock in the seal ring holder assembly.

If you have much wear on the flat sides of the sleeve spacers, you can install the sleeve spacers with the wear towards the support. See Figure 1002 (Sheet 2).

(4) Install the carbon seal face, aligning spring guide pins and sleeve spacers.

(5) Place PWA 85169 Protector over the carbon seal face assembly.

(6) Depress protector and carbon seal face assembly below holes in pins, install collars and cotter pins. Bend cotter pins.

(7) Remove PWA 85169 Protector.

C. Postrequisites

NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY − ASSEMBLY−01

(1) Do leak check on the No. 3 bearing rear (carbon) seal assembly. See Testing−01 (Task 72−41−85−790−001).

Inspect	Serviceable Limits
1. Sleeve Spacer For Wear	Examine the flat sides of the sleeve spacer with a hand held stylus tool. See Figure 1003. Hold the stylus loosely at a 30 degree angle to the wear surface. Guide the stylus perpendicular to the lay of the wear. Only use the weight of the stylus, do not force the stylus with your fingers. If the stylus catches on the wear, you must install the sleeve spacer with the wear towards the support, (away from the flange).

NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY - TESTING-01

Task 72-41-85-790-001:

1. Leak Check - No. 3 Bearing Rear (Carbon) Seal Assembly

A. Prerequisites

(1) See 72-41-85, Inspection/Check-00 PW4000 Series CIR, PN 51A357 for functional arrangement and part number applicability.

B. Equipment And Materials Necessary

Special Tools:

PWA 6507 Flowmeter
PWA 45411 Gage, Differential Pressure
PWA 46400 Flowmeter
PWA 85041 Fixture, Base

C. Procedure
See Figure 1301 and Figure 1302.

(1) Remove and inspect the seal plate (1302/5) for nicks and scratches in the micro finish surface.

(2) Install the seal plate (1302/5) in the PWA 85041 Base Fixture with the micro finish surface up.

(3) Connect the hoses from the PWA 46400 Flowmeter to the quick disconnect fittings (1302/3 and 1302/4) attached to the fixture base.

(4) Carefully position seal support assembly (1301/1) onto the fixture to seat the carbon seal assembly (1301/5), Surface B (1301/2) on the seal plate (1302/5).

(5) Attach the seal support assembly outer flange (1301/1) to the fixture base with washers and cap screws (1302/6).

(6) Connect the remaining hose from the PWA 46400 Flowmeter to the fitting on the top of the fixture.

(7) Connect the inlet hose to the inlet fitting (1302/1) on the top of the fixture.

(8) As an alternate to PWA 46400 Gage you may use PWA 6507 Flowmeter and PWA 45411 Gage to connect the flowmeter and gage to the fixture as follows:

NO. 3 BEARING REAR (CARBON) SEAL ASSEMBLY − TESTING−01

(a) Connect hose from PWA 6507 Flowmeter to larger of two quick−disconnect fittings marked FLOWMETER (1302/3) attached to fixture base.

(b) Attach smaller fitting of PWA 45411 Gage to the remaining fitting on fixture base.

(c) Attach air inlet hose to fitting marked INLET PINS (1302/1) on the cover.

(d) Attach the larger quick−disconnect fitting on the gage to the remaining quick−disconnect fitting on the fixture cover.

(9) Control the air pressure to the fixture slowly to 80 psi (551.6 kPa) and permit to stabilize five minutes.

NOTE: Although 80 psi (551.6 kPa) is the recommended air pressure, it is permitted for the air pressure to be 50 psi (344.7 kPa).

(10) Observe leakage on flowmeter. Total leakage between Surface B (1301/2), seal plate (1302/5) and seal ring (1301/3) must not exceed 4.5 CFM (0.13 cu m/min.) with 80 psi (551.6 kPa) pressure. Dimension C (1301/4) to be 1.433 − 1.463 inches (36.40 − 37.16 mm).

NOTE: With 50 psi (344.7 kPa) pressure, the leakage must not be more than 2.8 CFM (0.09 cu m/min).

(11) If leakage exceeds limits corrective action must be taken as follows:

(a) Replace seal ring, if necessary.

(b) Lap face of carbon seal. See 72−41−87, Repair−04 PW4000 Series CIR, PN 51A357.

(c) Repair the piston ring groove. See 72−41−86, Repair−02 PW4000 Series CIR, PN 51A357.

TURBINE NOZZLE - HOW TO USE MANUAL

Task 72-51-00-990-003:

1. Chapter/Section/Subject Numbering Outline

See Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant Turbine Nozzle parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

TURBINE NOZZLE - DESCRIPTION/OPERATION-00

Task 72-51-00-990-002:

1. Turbine Nozzle - Description And Operation

A. The turbine nozzle has been established as a convenient means of assembling and installing, as a package, the inner combustion chamber (liner) assembly, 1st stage HPT vane cluster assemblies (guide vanes), and 1st stage HPT (blade) cooling duct assembly into the engine. The turbine nozzle is positioned at the rear of the diffuser and combustor and forward of the high pressure turbine. The turbine nozzle is housed entirely within the rear section of the diffuser case.

B. The turbine nozzle, inner combustion chamber (liner) assembly along with the outer combustion chamber (liner) assembly provides a chamber where the compressed air from the high pressure compressor HPC is mixed with fuel in the optimum proportions and burned, greatly increasing the energy level and accelerating the hot gasses. The combustor assembly directs the hot gasses to the 1st stage turbine nozzle guide vanes. The turbine nozzle incorporates 17 vane clusters (air-cooled cobalt alloy vanes) bolted around the 1st stage HPT (blade) cooling duct assembly and retained at the OD by a support ring. The ring of vanes forms a series of nozzles that increase the velocity of the gasses exiting the combustion chamber and changes the direction of motion of these gasses to provide the optimum angle, pressure and flow of gasses to the 1st stage turbine blades.

C. The 1st stage HPT cooling duct assembly directs cooler, boundary, air from the interior of the diffuser case through metered nozzles onto the 1st stage turbine rotor to cool the 1st stage turbine blades. See Figure 1, Figure 2 and Figure 3.

D. Inner Combustion Chamber (Liner) Assembly

(1) The inner combustion chamber (liner) assembly is fabricated from rolled ring sections of nickel alloy material, welded together to form the ID portion of the combustion chamber. The forward section or lip of this liner fits into the inner (bulkhead) section of the outer combustion chamber (liner) assembly. This forms the complete burner or combustion chamber (liner). The forward fit of the inner liner to the outer liner is accomplished through a slip joint seal. The inner liner is a short double pass flow type liner for efficient and even airflow and film cooling. The inner surfaces exposed to the combustion gasses are

coated with a magnesium zirconate material as a thermal barrier coating.

E. Stage 1 HPT Vane Cluster Assembly

(1) The 1st stage HPT vane clusters are assembled to form a ring of vanes positioned at the rear of the combustion chamber between the inner and outer combustion chamber assemblies (liners). The assembly consists of 17 clustered vane assemblies with two vanes per cluster for a total of 34 vanes. The vane clusters are cast from a nickel cobalt alloy.

(2) Each hollow vane incorporates internal baffles and cooling holes in the airfoil which allow boundary cooling air from the diffuser case to be directed through the vane and over the exterior of the airfoil to reduce metal temperature. Vane airfoils are also coated with heat−resistant material to further improve durability. Sheet metal seals are installed between adjacent vane cluster platforms to reduce gaspath leakage and ensure adequate cooling airflow. See Figure 4 for typical vane internal cooling scheme.

F. Stage 1 HPT (Blade) Cooling Duct Assembly

(1) The 1st stage HPT (blade) cooling duct assembly consists of a cast case and nozzle, with brazed on honeycomb nozzle seals, the cast case also forms the rear of the inner combustion chamber area as well as providing for the cooling air nozzles. The cooling duct is bolted to the rear of the ID wall of the diffuser case and is the main structural support for the ring of 1st stage HPT vane clusters and inner combustion chamber assembly (liner). Both the 1st stage vanes and inner combustion chamber assembly (liner) are retained by the cooling air duct at a flange at the rear OD of the cooling air duct case. The cooling air nozzles on the cooling air nozzle case are sealed by two honeycomb seal lands that align with knife−edge seals on the 1st stage HPT rotor.

TURBINE NOZZLE - REMOVAL-01

Task 72-51-00-030-002:

1. Remove Inner Combustion Chamber

NOTE: See Figure 301 for part/assembly removal procedure.

A. Prerequisites
  (1) Remove turbine nozzle per 72-00-51, Removal-01 (Task 72-00-51-020-001).
B. Equipment And Materials Required

Special Tools:

PWA 27918 Sling (Optional To PWA 80555)
PWA 28657 Sling, Strongback
PWA 76154 Adapter (Two Required)
PWA 80555 Sling, Handling
PWA 85078 Fixture, Holding

C. Procedure
  (1) Using two PWA 76154 Adapters, attach hoist with PWA 28657 Sling to trunnion spools on PWA 85078 Fixture. Using hoist lift and trunnion fixture to position with support posts up.
  (2) Loosen and retract clamps and position fixture over rear of turbine nozzle. Slide four clamps (302/11) over OD flange of 1st stage HPT cooling duct (302/9) and secure with hand knobs (302/10). Slide clamps (302/7) over rear lip of 1st stage HPT support (302/8) and secure with bolts (302/6).
  (3) Using hoist position turbine nozzle on bench, inner combustion chamber (302/5) end down.
  (4) Remove bolts (302/2, 302/1) securing 17 1st stage HPT duct stops (302/3) and 1st stage HPT duct segments (302/4) to inner combustion chamber. Remove duct stops and duct segments.
  (5) Using hoist, raise turbine nozzle to separate inner combustion chamber from 1st stage HPT cooling duct (302/9). If required, tap combustion chamber support flange with rawhide mallet to separate combustion chamber.
  (6) Using hoist, sling and adapters, trunnion assembly and position fixture with support posts down on bench.
  (7) Using PWA 80555 or PWA 27918 Sling position inner combustion liner on pallet.

TURBINE NOZZLE - REMOVAL-01

TURBINE NOZZLE - REMOVAL-02

Task 72-51-00-030-003:

1. Remove 1st Stage HPT Vane/Vane Cluster Assemblies

NOTE: See Figure 301 for part/assembly removal procedure.

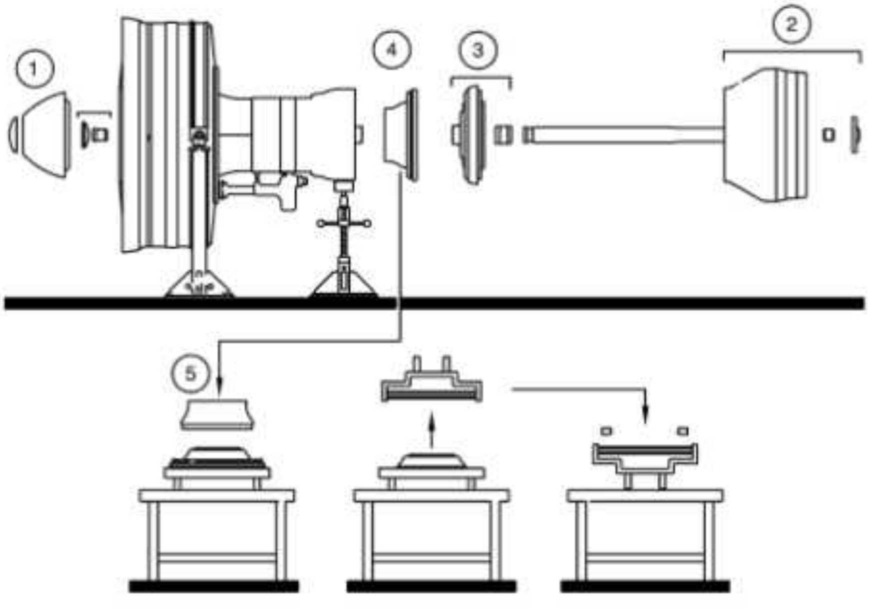
A. Prerequisites
  (1) Remove inner combustion chamber assembly per Removal-01 (Task 72-51-00-030-002).

B. Equipment And Materials Required

Special Tools:
PWA 28657 Sling, Strongback
PWA 76154 Adapter
PWA 85077 Fixture, Assembly

C. Procedure
  (1) If required, remove bolt (302/8), nut (302/9) and spacer (302/4) securing combustion chamber clamp (302/1) to combustion chamber guides. See Figure 302.
  (2) Remove bolts (302/7), nuts (302/5) and combustion chamber guide plates (302/6) securing combustion chamber guide (upper and lower segments) (302/2) and (302/9) to front outer flanges of vanes. Remove guides.
  (3) Using two PWA 76154 Adapters, attach hoist with PWA 28657 Sling to trunnion spools on PWA 85077 Fixture.
  (4) Loosen and retract clamps and position fixture over turbine nozzle vanes and secure with detail clamps. See Figure 303.
  (5) Remove clamps (303/3) securing 1st stage HPT support to (PWA 85078) Fixture.
  (6) Using hoist and sling connected to Fixture (PWA 85077) raise vane and support assembly and trunnion fixture to position with support posts down.
  (7) Carefully separate vane/vane cluster assemblies and remove seals from slots in inner and outer vane platforms. See Figure 304.

D. Postrequisites
  (1) (Post SB PW4ENG 72-467 only) If applicable, disassemble the Stage 1 (vane) HPT support assembly. Refer to 72-51-00, Disassembly-01 (Task 72-51-00-030-001).



1. REMOVE COMPRESSOR INLET CONE
2. REMOVE LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH SHAFT
3. REMOVE HIGH PRESSURE TURBINE
4. REMOVE TURBINE NOZZLE
5. REMOVE INNER COMBUSTION CHAMBER

TURBINE NOZZLE - INSTALLATION-01

Task 72-51-00-430-001:

1. Install Inner Combustion Chamber

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 (Task 72-51-00-990-001) for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

B. Equipment And Materials Required

Special Tools:
PWA 27918 Sling (Optional To PWA 80555)
PWA 28657 Sling, Strongback
PWA 29855-2 Pin (Three Required)
PWA 76154 Adapter (Two Required)
PWA 80555 Sling, Handling

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)

C. Procedure

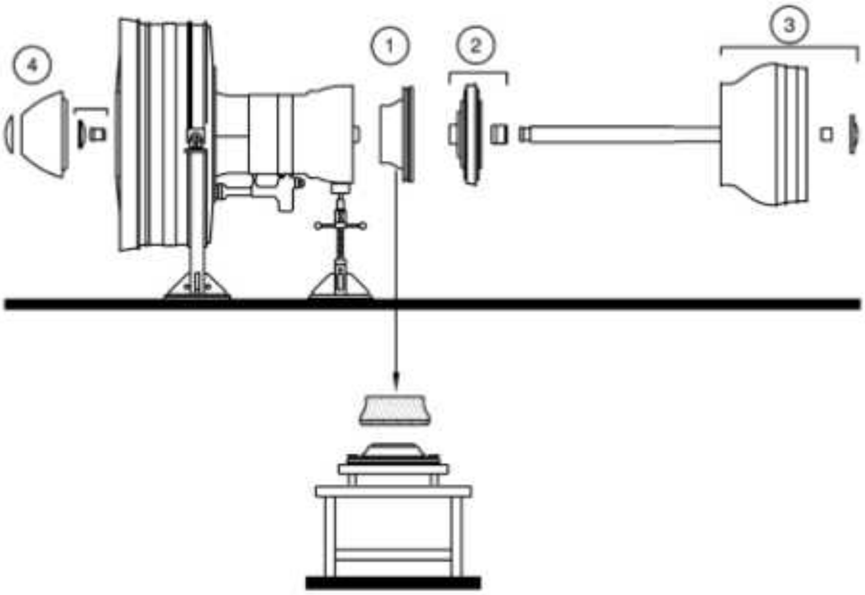
CAUTION: OUTER AND INNER COMBUSTION CHAMBER ASSEMBLIES WITH REVISED DILUTION HOLES (DECREASED EMISSIONS) MUST BE USED IN SETS WITH COMBUSTION CHAMBER GUIDE ASSEMBLIES (REFERENCE SB PW4ENG 72-187).

(1) Using hoist, connect PWA 80555 or PWA 27918 Sling (402/1) to cooling holes in inner combustion chamber (402/2). See Figure 402.

(2) Install three PWA 29855-2 Pins (402/6) approximately 120 degrees apart into the rear flange of the combustion chamber.

(3) Use a hoist to put the combustion chamber over the 1st stage HPT cooling duct (402/5) and vane assembly. Align the locating pin (402/4) in the duct with the locating pin hole (402/3) in the combustion chamber rear plate detail. Lower the combustion chamber onto the duct. Temporarily secure the combustion chamber to the cooling duct with three equally spaced workbolts.

TURBINE NOZZLE − INSTALLATION−01



1. INSTALL TURBINE NOZZLE
2. INSTALL HIGH PRESSURE TURBINE
3. INSTALL LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH SHAFT
4. INSTALL COMPRESSOR INLET CONE

TURBINE NOZZLE − INSTALLATION−01

(4) Using hoist, PWA 28657 Sling and two PWA 76154 Adapters attached to trunnion spools of Fixture (PWA 85078), trunnion assembly to front end down position.

(5) Remove the Pins (PWA 45548) and the workbolts. Position the 17 1st stage HPT duct segments (403/4) over the 1st stage HPT cooling air duct (403/9), with the oval slots in the duct segments toward the cooling duct. Align the bolthole in each duct segment with the round boltholes in the lugs of the vane clusters. Attach the duct segments with the 17 bolts (403/1) lubricated with Engine Oil (P03−001). Tighten the bolts by hand only. See Figure 403.

(6) Install the 17 1st stage HPT duct stops (403/3) into the slots between the duct segments. The bolthole in each stop must align with the elongated boltholes in the lugs of the vane clusters. Attach the duct stops with the bolts (403/2) lubricated with Engine Oil (P03−001). Tighten the bolts by hand only.

(7) Torque the 17 bolts (403/1) to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(8) Torque the 17 bolts (403/2) to 85 − 95 lb−in. (9.604 − 10.734 N.m).

(9) Loosen bolts (403/6) and slide clamps (403/7) outward from 1st stage HPT support (403/8). Loosen hand knobs (403/10) and slide four clamps (403/11) outward from 1st stage HPT cooling duct (403/9).

(10) Using hoist, connect Sling (PWA 28657) with two Adapters (PWA 76154) to trunnion spools of Fixture (PWA 85078). Using hoist, remove fixture and trunnion to legs end down position. Lower fixture onto pallet. Remove hoist, sling and adapters.

Figure 403
(Task 72−51−00−430−001)

TURBINE NOZZLE - INSTALLATION-02

Task 72-51-00-430-002:

1. Install 1st Stage HPT Vane/Vane Cluster Assemblies

NOTE: See Figure 401 for part/assembly installation procedure sequence.

A. Prerequisites

(1) See Inspection/Check-01 Task 72-51-00-990-001 for interface fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows:

(2) (Post SB PW4ENG 72-467 only) For assembly of the two piece Stage 1 (vane) support assembly, see 72-51-01 Assembly-01 Task 72-51-01-400-001.

B. Equipment And Materials Required

Special Tools:

PWA 28657	Sling
PWA 76154	Adapter (Two Required)

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

C. Procedure
See Figure 402, Figure 403 and Figure 404.

(1) Install vane (feather) seals into the grooves in 1st stage HPT vane/vane cluster. Install seals in sets at locations shown in Figure 402. Apply Beeswax P05-395 or Paraffin Wax Blend P05-396 to sides of seals to secure in place. See Figure 402.

NOTE: Clustered vanes (Pre SB PW4ENG 72-471) and single vanes (Post SB PW4ENG 72-471) can be used together, two single vanes used in place of one clustered vane assembly. At the locations where the clusters and single vanes are adjacent, use a (feather) seal PN 50K320 at the OD. At the ID use the (feather) seal PN 50K186 at the front and (feather) seal PN 50K187 at the rear.

NOTE: Install vane clusters together and the single vanes together so that there are only two locations where single vanes and vane clusters are adjacent. This will minimize air leakage.

NOTE: See Figure 403, (Sheet 1) for Pre and Post SB PW4ENG 72−467 configuration 1st stage HPT vane support assemblies.

(2) (Reference 30) With the (feather) seals installed, position the the first vane, (or vane cluster) outer rear flange, into the 1st stage HPT vane support (403/2). Install the first vane positioning pin located on the front side of the rear outer flange, into the locating pin slot (403/5). Install the remaining vanes/vane cluster assemblies in the support in both directions.

NOTE: It will be easier to install the last vane or vane cluster in the assembly if it is located approximately 180 degrees from the locating pin slot in the vane support.

(3) Using feeler gage, ensure that all seals are installed between vanes/vane clusters.

(4) Secure vane front inner flanges to fixture using detail clamps.

(5) Using hoist, attach PWA 28657 Sling with two PWA 76154 Adapters to trunnion spools of Fixture (PWA 85077). Lift and trunnion vane and support assembly and position over 1st stage HPT cooling duct (403/1). See Figure 403.

(6) Locate slot (403/5) in 1st stage HPT support (403/2). Lower vane and support assembly onto Fixture (PWA 85078) with slot in support aligned with slot (scribed) line on fixture base.

(7) Secure rear OD of 1st stage HPT support (403/2) to fixture using detail clamps (403/3). Remove Fixture (PWA 85077), adapters and sling. Tighten bolts (403/4) to secure clamps.

TURBINE NOZZLE - INSTALLATION-02

CAUTION: OUTER AND INNER COMBUSTION CHAMBER ASSEMBLIES WITH REVISED DILUTION HOLES (DECREASED EMISSIONS) MUST BE USED IN SETS WITH COMBUSTION CHAMBER GUIDE ASSEMBLIES (REFERENCE SB PW4ENG 72-187).

(8) Position combustion chamber guide (upper segment) (404/3) and (lower segment) (404/5) over outer lugs of vanes. Locate instrumentation guide (borescope) detail (404/4) of combustion chamber guide (upper segment) approximately 93 degrees counterclockwise from locating pin in OD of cooling duct. See Figure 404.

(9) (Pre SB PW4ENG 72-542) Align bolt holes and Position 17 combustion chamber guide plates (404/2) between lugs of combustion chamber guide segments. Secure guide plates and guide segments with 34 bolts (404/1) and nuts (404/6). Install bolts with bolt head up and flat machined edge of bolt head toward OD of assembly. Tighten the bolts until the flanges touch. Do not torque the bolts.

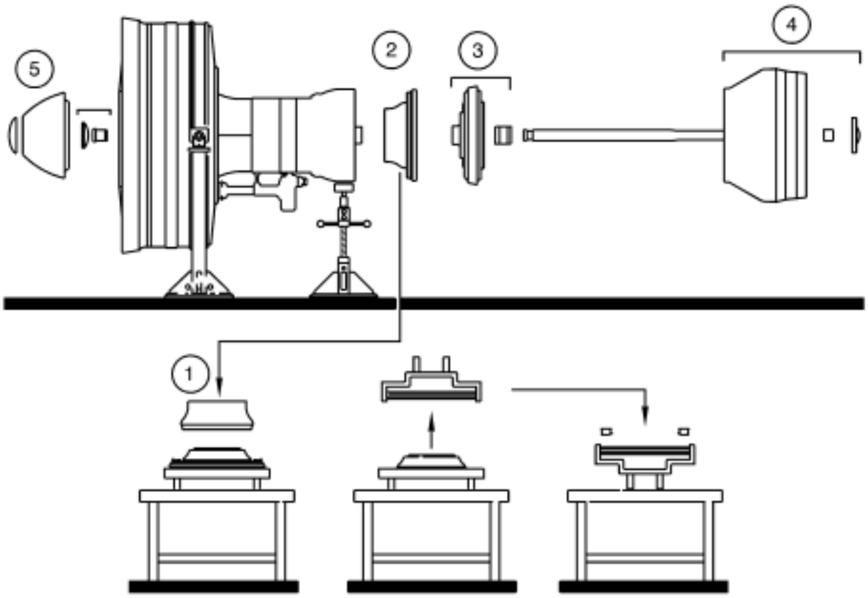
(10) (Post SB PW4ENG 72-542) Align bolt holes and Position 17 combustion chamber guide plates (404/2) between lugs of combustion chamber guide segments. Secure guide plates and guide segments with 34 bolts (404/1), threads lubricated with Engine Oil P03-001, and nuts (404/6). Install bolts with bolt head up. Tighten the bolts until the flanges touch. Do not torque the bolts.

NOTE: Bolts (404/1) will be torqued at engine assembly in 72-00-51, Installation-01 Task 72-00-51-420-001 or 72-00-51, Installation-02 Task 72-00-51-420-002 as necessary.

D. Postrequisites

(1) Install inner combustion chamber per Installation-01 Task 72-51-00-430-001.

TURBINE NOZZLE - INSTALLATION-02



1. INSTALL INNER COMBUSTION CHAMBER
2. INSTALL TURBINE NOZZLE
3. INSTALL HIGH PRESSURE TURBINE
4. INSTALL LOW PRESSURE TURBINE AND TURBINE EXHAUST CASE WITH SHAFT
5. INSTALL COMPRESSOR INLET CONE

TURBINE NOZZLE - DISASSEMBLY-01

Task 72-51-00-030-001:

1. Disassemble Turbine Nozzle

A. Equipment And Materials Necessary

Special Tools:

PWA 27918 Sling (Optional To PWA 80555)
PWA 28657 Sling, Strongback
PWA 76154 Adapter (Two Necessary)
PWA 80555 Sling, Handling
PWA 85077 Fixture, Assembly
PWA 85078 Fixture, Holding
PWA 102145 Fixture, Removal

B. Procedure

Subtask 72-51-00-030-051:

(1) Using two PWA 76154 Adapters, attach hoist with PWA 28657 Sling to trunnion spools on PWA 85078 Fixture. Using hoist lift and trunnion fixture to position with support posts up.

(2) Loosen and retract clamps and position fixture over rear of turbine nozzle. Using detail clamps, secure 1st stage HPT cooling duct and 1st stage support to fixture. See Figure 501.

(3) Using hoist position turbine nozzle on bench, inner combustion chamber (501/5) end down.

(4) Remove bolts (501/2, 501/1) securing 17 1st stage HPT duct stops (501/3) and 1st stage HPT duct segments (501/4) to inner combustion chamber. Remove duct stops and duct segments.

(5) Using hoist, raise turbine nozzle to separate inner combustion chamber liner from 1st stage HPT cooling duct (501/9). If required, tap combustion chamber support flange with rawhide mallet to separate combustion chamber.

(6) Using hoist, sling and adapters, trunnion assembly and position fixture with support posts down on bench.

(7) Using PWA 80555 or PWA 27918 Sling position inner combustion on pallet.

TURBINE NOZZLE − DISASSEMBLY−01

Subtask 72−51−00−030−052:

(8) If applicable, remove bolt (502/8), nut (502/3) and spacer (502/4) securing combustion chamber clamp (502/1) to combustion chamber guides. See Figure 502.

(9) Remove bolts (502/7), nuts (502/5) and combustion chamber guide plates (502/6) securing combustion chamber guide (upper and lower segments) (502/2) and (502/9) to front outer flanges of vane clusters. Remove guides.

Subtask 72−51−00−030−053:

(10) Using two Adapters PWA 76154, attach hoist with Sling PWA 28657 to trunnion spools on PWA 85077 Fixture.

(11) Loosen and retract clamps and position fixture over turbine nozzle vanes and secure with detail clamps. See Figure 503.

(12) Remove clamps (503/3) securing 1st stage HPT support to Fixture PWA 85078.

(13) Using hoist and sling connected to Fixture PWA 85077, raise vane and support assembly and trunnion fixture to position with support posts down.

(14) Loosen and retract clamps and remove 1st stage HPT cooling duct (503/1) from fixture.

(15) Attach rear flange of the 1st stage HPT cooling duct (503/1) to PWA 102145 Removal Fixture and remove the HPT cooling duct deflector from the front of the HPT cooling duct.

Subtask 72−51−00−030−054:

(16) Carefully separate 1st stage HPT vane/vane cluster assemblies and remove the seals from the slots in the inner and outer vane platforms. See Figure 504.

(17) Loosen and retract clamps securing 1st stage HPT support to Fixture PWA 85077. Using hoist and sling, remove fixture from bench.

R
R

Subtask 72−51−00−030−055:

(18) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the Stage 1 HPT brush seal and support assembly (505/2) from the Stage 1 HPT cooing duct assembly (505/1). See Figure 505.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R In the following step, replace the Stage 1 HPT
R brush seal assembly with a new assembly as
R follows:

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R If the 1st stage HPT inner airseal is replaced
R with a new or refurbished part.

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R If the 1st stage HPT inner airseal was removed
R and re−installed on the 1st stage turbine hub
R regardless of the reason for the removal and
R re−installation.

NOTE: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R The 1st stage HPT inner airseal is
R installed in 72−52−01, Assembly−01 (Task
R 72−52−01−440−001).

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R When the match of the 1st stage HPT inner
R airseal and brush seal is changed. Such as in
R a module swap.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R Remove the 24 bolts (505/3) that attach the brush
seal and support assembly to the cooling duct.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
R Install 12, 0.250−28 jackscrews into the jackscrew
holes in the brush seal support. Evenly tighten the jackscrews to remove the brush seal and support assembly from the cooling duct. Remove the jackscrews from the support assembly.

C. Postrequisites

(1) (Post SB PW4ENG 72−467 only) If applicable, disassemble the Stage 1 (vane) HPT support assembly (PN 50K184). Refer to 72−51−01, Disassembly−01 (Task 72−51−01−030−001).

TURBINE NOZZLE − INSPECTION/CHECK−01

Task 72−51−00−990−004:

1. General Inspection Requirements − Turbine Nozzle

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check−00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check−00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check−01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check−02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−51−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−51−99 is limited to cleaning, non−destructive inspection, and the following:

(1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

(2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

(1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

(2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

TURBINE NOZZLE - INSPECTION/CHECK-03

Task 72-51-00-990-005:

1. Visual Inspection - Turbine Nozzle
    A. For inspection requirements applicable to installed (accessible) parts of Turbine Nozzle see 72-00-51, Inspection/Check-XX (Task 72-00-51-XXX-XXX).

Previous Pageblock Return to Previous Menu Next Pageblock

TURBINE NOZZLE − INSPECTION/CHECK−04

Task 72−51−00−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (−) 0.512 = .005
(13.131) (13.005) (0.126)

0.527 (−) 0.508 = .019
(13.385) (12.903) (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

	Ref. No.	IFR	Description	New Part Reference Dimensions Min	Max	Limits Min	Max

TURBINE NOZZLE − INSPECTION/CHECK−04

Task 72−51−00−990−006:

1. Specific Fits And Clearances

   A. General

      (1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

      (2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

      (3) Numbers in all columns shall be interpreted in inches, and (millimeters).

      (4) Letter "T" following limits indicates tight fit.

      (5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

      (6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

   B. Inspection Frequency Requirements

      (1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (-) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (-) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

	Ref. No.	I F R	Description	New Part Reference Dimensions Min	Max	Limits Min	Max
	1	B	Inner Combustion Chamber Assembly (72−51−05) Stage 1 HPT (Blade) Cooling Duct Assembly (72−51−03) (See Figure 801)

(Task 72-51-00-990-006)

TURBINE NOZZLE - ASSEMBLY-01

Task 72-51-00-400-001:

1. Assemble Turbine Nozzle

A. Prerequisites

(1) (Post SB PW4ENG 72-467) If applicable, assemble the Stage 1 (vane) HPT support assembly (PN 50K184). Refer to 72-51-01, Assembly-01 Task 72-51-01-400-001.

B. Equipment And Materials Necessary

Special Tools:

PWA 27918	Sling (Optional To PWA 80555)
PWA 28657	Sling, Strongback
PWA 76154	Adapter (Two Necessary)
PWA 80555	Sling, Handling
PWA 85077	Fixture, Assembly
PWA 85078	Fixture, Holding

Consumable Materials:

Item No.	Designation
P03-001	Oil, Engine (PWA 521B)
P05-395	Beeswax
P05-396	Paraffin Wax Blend

C. Procedure

Subtask 72-51-00-430-051:

(1) Using hoist, attach PWA 28657 Sling with two PWA 76154 Adapters to trunnion spools on PWA 85077 Fixture. Position fixture on bench with support posts down.

(2) Position 1st stage HPT support (1001/3) lug end down, into upper ring detail of Fixture (PWA 85077) and secure with detail clamps. See Figure 1001.

CAUTION: YOU MUST USE NON-CUTBACK SINGLE OR CLUSTER VANES, CUTBACK SINGLE OR CLUSTER VANES OR RESTAGGERED VANES IN COMPLETE SETS ONLY OR DAMAGE TO THE ENGINE CAN OCCUR.

(3) Install vane (feather) seals into grooves in 1st stage HPT vane/vane cluster. Install seals in sets at locations shown in Figure 1001. Apply Beeswax P05-395

or Paraffin Wax Blend P05−396 to sides of seals to secure in place.

NOTE: Clustered vanes (Pre SB PW4ENG 72−471) and single vanes (Post SB PW4ENG 72−471) can be used together, two single vanes used in place of one clustered vane assembly. At the locations where the clusters and single vanes are adjacent, use a (feather) seal PN 50K320 at the OD. At the ID use the (feather) seal PN 50K186 at the front and (feather) seal PN 50K187 at the rear.

NOTE: Install vane clusters together and the single vanes together so that there are only two locations where single vanes and clustered vanes are adjacent. This will minimize air leakage.

NOTE: See Figure 1002 (Sheet 1) for Pre and Post SB PW4ENG 72−467 configuration 1st stage (vane) support assemblies.

(4) (Reference 30) With the (feather) seals installed, position the the first vane, (or vane clusters) outer rear flange, into 1st stage HPT vane support (1002/3). Install the first vane positioning pin (1002/4) on front side of rear outer flange, into locating pin slot (1002/2). Install the remaining vanes, or vane clusters, clusters in the support in both directions.

NOTE: It will be easier to install the last vane or vane cluster, in the assembly if it is located approximately 180 degrees from the locating pin slot in the vane support.

(5) Using feeler gage, ensure that all seals are installed between vanes, or vane clusters.

(6) Secure vanes front inner flanges to fixture using detail clamps.

Subtask 72−51−00−430−052:

(7) Using hoist, attach Sling (PWA 28657) with two Adapters (PWA 76154) to trunnion spools on PWA 85078 Fixture. Position fixture on bench. See Figure 1003.

(8) Position 1st stage HPT cooling duct (1003/2), with large OD flange end down, onto inner ring detail of Fixture (PWA 85078). Position locating pin (1003/4) at scribed line 11° 28" to right of slot location scribed line on fixture base. Secure cooling duct outer airseal support flange to fixture using detail clamps.

CAUTION: THE PS4I HOLE IN THE HPT COOLING DUCT DEFLECTOR MUST BE ALIGNED WITH THE 0.378 − 0.380 INCH (9.602 − 9.652 mm) PS4I HOLE IN THE 1ST STAGE HPT COOLING DUCT. IF THE PS4I HOLE IS BLOCKED, AN INCORRECT PRESSURE READING WILL OCCUR.

(9) Align the boltholes and the PS4I hole, and position the HPT cooling duct deflector (1003/1), with the larger diameter down, over the flange of the cooling duct. Seat the deflector on the cooling duct.

NOTE: If necessary, standard pins can be used to align the boltholes of the deflector with the mating holes in the cooling duct.

(10) Using hoist, attach Sling (PWA 28657) with two Adapters (PWA 76154) to trunnion spools of Fixture (PWA 85077). Lift and trunnion vane and support assembly and position over cooling duct (1004/1). See Figure 1004.

(11) Locate slot (1004/7) in 1st stage HPT support (1004/2). Lower vane and support assembly onto Fixture (PWA 85078) with slot in support aligned with slot (scribed) line on fixture base.

(12) Secure rear OD of 1st stage HPT support (1004/2) to fixture using detail clamps (1004/3). Remove Fixture (PWA 85077), adapters and sling.

Subtask 72−51−00−430−053:

CAUTION: OUTER AND INNER COMBUSTION CHAMBER ASSEMBLIES WITH REVISED DILUTION HOLES (DECREASED EMISSIONS) MUST BE USED IN SETS WITH COMBUSTION CHAMBER GUIDE ASSEMBLIES (REFERENCE SB PW4ENG 72−187).

(13) (Post SB PW4ENG 72−558) Position combustion chamber guide (upper segment) (1005/3) and (lower segment) (1005/5) over outer lugs of vanes. Locate instrumentation guide detail (1005/4) of combustion

chamber guide (upper segment) approximately 93 degrees counterclockwise from locating pin in OD of 1st stage HPT cooling duct. See Figure 1005 (Sheet 1).

(14) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Position combustion chamber guide (upper segment) (1005/3) and (lower segment) (1005/5) over outer lugs of vanes. Locate instrumentation guide detail (1005/4) of combustion chamber guide (upper segment) approximately 93 degrees counterclockwise from locating pin in OD of 1st stage HPT cooling duct. See Figure 1005 (Sheet 2).

(15) Align boltholes and position 17 combustion chamber guide plates (1005/2) between lugs of combustion chamber guide segments. Secure guide plates and guides with 34 bolts (1005/1) and nuts (1005/6). Install bolts with boltheads up and flat machined edge of bolthead toward OD of assembly. Do not torque bolts.

NOTE: Bolts (1005/1) will be torqued at engine assembly in 72−00−51, Installation−01 (Task 72−00−51−420−001) or 72−00−51, Installation−02 (Task 72−00−51−420−002) as necessary.

Subtask 72−51−00−430−054:

(16) Use a hoist to connect PWA 80555 or PWA 27918 Sling (1006/1) to the cooling holes in the inner combustion chamber (1006/2).

(17) Install three PWA 29855−2 Pins (1006/6) approximately 120 degrees apart into the rear flange of the combustion chamber.

(18) Use a hoist to put the combustion chamber over the 1st stage HPT cooling duct (1006/5) and vane assembly. Align the locating pin (1006/4) in the duct with the locating pin hole (1006/3) in the combustion chamber rear plate detail. Lower the combustion chamber onto the duct. Temporarily attach the combustion chamber to the cooling duct with three equally spaced workbolts.

(19) Use a hoist and Sling (PWA 28657) attached to Fixture (PWA 85078) (1006/7) trunnion the assembly to front end down position. Remove the hoist and sling.

TURBINE NOZZLE - ASSEMBLY-01

(20) Remove the Pins (PWA 25855-2) and the workbolts. Position the 17 1st stage HPT duct segments (1007/4) over the 1st stage HPT cooling air duct (1007/9), with the oval slots in the duct segments toward the cooling duct. Align the bolthole in each duct segment with the round boltholes in the lugs of the vane clusters. Attach the duct segments with the 17 bolts (1007/1) lubricated with Engine Oil P03-001. Tighten the bolts by hand only. See Figure 1007.

(21) Install the 17 1st stage HPT duct stops (1007/3) into the slots between the duct segments. The bolthole in each stop must align with the elongated boltholes in the lugs of the vane clusters. Attach the duct stops with the bolts (1007/2) lubricated with Engine Oil P03-001. Tighten the bolts by hand only.

(22) Torque the 17 bolts (1007/1) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(23) Torque the 17 bolts (1007/2) to 85 - 95 lb-in. (9.604 - 10.734 N.m).

(24) Attach hoist, Sling (PWA 28657) and two Adapters (PWA 76154) to trunnion spools of Fixture (PWA 85078). Using hoist, position assembly on pallet.

(25) Loosen bolts (1007/6) and slide clamps (1007/7) outward from 1st stage HPT support (1007/8). Loosen hand knobs (1007/10) and slide four clamps (1007/11) outward from 1st stage HPT cooling duct (1007/9).

(26) Using hoist, remove fixture and trunnion to legs end down position. Lower fixture onto pallet. Remove hoist, sling and adapters from fixture.

Pratt & Whitney
PW4000 SERIES ENGINE MANUAL (PN 50A443)

Please insert the revised pages into this manual and delete obsoleted pages in accordance with the following List of Effective Pages. Revised pages are indicated by the letter "R", added pages by the letter "A", and deleted pages by the letter "D". Superseded pages shall be removed and destroyed.

The List of Effective Pages records not only each page of subject revision but also each previously issued page which is still current. Blank pages and pages which are no longer current do not appear on this list. If there is any question about the currency of the maintained copy, it is recommended that each page of the manual be checked off against this List of Effective Pages. Any page which does not check out with this list, either by number or by date, shall be discarded. This list is reissued in its entirety whenever this manual section is revised.

Tab Separator - Turbine Nozzle

List of Effective Pages - Turbine Nozzle
See end of list.

STAGE 1 (VANE) HPT SUPPORT ASSEMBLY - DISASSEMBLY-01

Task 72-51-01-030-001:

1. (Post SB PW4ENG 72-467) Disassemble The Stage 1 (Vane) HPT Support Assembly (PN 50K184) - Stage 1 (Vane) HPT Support Assembly - Deleted

A. Procedure

Subtask 72-51-01-030-002:

(1) This procedure has been deleted.

Previous Pageblock Return to Previous Menu Next Pageblock

STAGE 1 (VANE) HPT SUPPORT ASSEMBLY - ASSEMBLY-01

Task 72-51-01-400-001:

1. (Post SB PW4ENG 72-467) Assemble The Stage 1 (Vane) HPT Support Assembly (PN 50K184) - Stage 1 (Vane) HPT Support Assembly

A. Equipment And Materials Required

Special Tools:
PWA 29754 Control (Or Equivalent)
PWA 76156 Adapters (Two Necessary)
PWA 87012 Heater (Or Equivalent)
PWA 88643 Sling, Lifting (Optional to PWA 88673)
PWA 88673 Sling, Lifting (Optional to PWA 88643)
PWA 101533 Fixture, Assembly/Disassembly

B. Procedure

See Figures 1001 and 1002.

Subtask 72-51-01-430-001:

(1) Put the 1st stage HPT vane support (1001/5), larger OD end down, on blocks.

(2) Install 34 bolts (1001/4) into the larger boltholes in the support flange.

(3) Attach PWA 101533 Fixture to the vane support.

(4) Lift and turn the fixture with the support assembly, to the fixture end down position, and lower onto the workbench.

(5) Put 34 spacers (1001/3) on the bolts.

WARNING: BE CAREFUL WHEN YOU USE A HEATER TO ASSEMBLE PARTS. USE GLOVES WHEN YOU TOUCH OR LIFT THE HEATER OR THE PARTS. THE HEATER OR THE PARTS CAN BE HOT AND CAUSE BURNS.

CAUTION: THE HEATER THERMOCOUPLE MUST TOUCH THE SUPPORT OR OVERHEATING OF THE SUPPORT CAN OCCUR.

(6) Install a PWA 87012 Heater with a PWA 29754 Control on the support. Heat the support assembly to 300°F (148.9°C) maximum. Remove the heater and control.

(7) Align the boltholes and lower the anti-rotation lock (1001/2) onto the vane support.

(8) Install 34 nuts (1001/1), lubricated with Engine Oil (P03−001) onto the bolts. Torque the nuts to 85 − 95 lbf−in. (9.604 − 10.734 N.m).

(9) After the parts have cooled, re−torque the nuts to 85 − 95 lbf−in. (9.604 − 10.734 N.m).

(10) Use the hoist, two PWA 76156 Adapters, and PWA 88643 or PWA 88673 Sling to lift and turn the assembly to put the anti−rotation lock end down. Release the fixture clamps. Remove the fixture, hoist, sling and adapters.

Subtask 72−51−01−430−002:

WARNING: BE CAREFUL WHEN YOU USE A HEATER TO ASSEMBLE PARTS. USE GLOVES WHEN YOU TOUCH OR LIFT THE HEATER OR THE PARTS. THE HEATER OR THE PARTS CAN BE HOT AND CAUSE BURNS.

(11) Install the 1st stage HPT seal support into the ID groove in the support assembly. Local heating of the seal to 500°F (260°C) maximum is permitted to help assemble the parts. See Figure 1002.

INNER COMBUSTION CHAMBER ASSEMBLY - DISASSEMBLY-01

Task 72-51-05-040-001:

1. Disassemble The Inner Combustion Chamber Assembly (Talon II Low Emission Burner)

   A. Prerequisites

      (1) Remove the inner combustion chamber assembly from the turbine nozzle by 72-51-00, Disassembly-01 (Task 72-51-00-030-002).

   B. Procedure

      NOTE: It is necessary to remove the liner segments that are installed closest to the inner combustion chamber front OD and then work rearward.

      (1) Remove the liner segments from the inner combustion chamber assembly as follows. See Figure 501.

         (a) Loosen and remove the nuts (501/8) and washers (501/7) and (501/9) as necessary for each liner segment. Discard all the nuts and the damaged washers.

         (b) Carefully remove each liner segment (501/1), (501/2), (501/3), (501/4), (501/5) and (501/6) from the inner combustion chamber.

Task 72-51-05-440-001:

1. Assemble The Inner Combustion Chamber Assembly (Talon II Low Emission Burner)

R A. Equipment And Materials Necessary - None

B. Procedure
See Figure 1001.

R CAUTION: DO NOT USE ANY LUBRICATION ON THE THREADS.

(1) Install the liner segments to the rearmost inner combustion chamber location as follows.

R NOTE: Installation of the liner segments must begin at the rearmost combustion chamber location (large OD end) and continue forward.

R (a) Install the twelve liner segments (1001/5) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 - 35 lb-in.
R (2.825 - 3.954 N.m).

(2) Install the liner segments to the 2nd rearmost inner combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/4) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 - 35 lb-in.
R (2.825 - 3.954 N.m).

(3) Install the liner segments to the 3rd rearmost inner combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/3) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

(4) Install the liner segments to the 4th rearmost inner combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/2) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

(5) Install the liner segments to the 5th rearmost inner combustion chamber location as follows.

R (a) Install the twelve liner segments (1001/1) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

(6) Install the liner segments to the last remaining inner combustion chamber location (closest to the small OD) as follows.

R (a) Install the twelve liner segments (1001/6) to the combustion chamber and attach the segments to the chamber with one washer (1001/9), at the center stud location, and one nut (1001/8) for each liner segment installed.

R (b) Install washers (1001/7), with the washer dimple in the slot of the chamber wall, and nuts (1001/8) to the remaining studs of each of the liner segments.

R (c) Torque the liner segment nuts to 25 − 35 lb−in.
R (2.825 − 3.954 N.m).

HIGH PRESSURE TURBINE (HPT) - HOW TO USE

Task 72-52-00-990-003:

1. Chapter/Section/Subject Numbering Outline

Figure 1.

NOTE: See the tab separated How To Use Manual section located at the beginning of this manual set for information concerning Data Location Guidelines and a complete Chapter/Section/Subject numbering outline for all manual sections.

A. The following is a complete listing of the individual Chapter/Section/Subject numbers and specific nomenclatures which have been assigned to the significant High Pressure Turbine (HPT) parts.

(1) Numbers which are not assigned are indicated in the list by one of the following terms:

UNASSIGNED - This designation is for numbers intentionally omitted and reserved for possible future use.

NOT USED - This designation is applied to numbers used in other related engine model programs which are not, at this time, applicable to the engine models represented by this manual.

HIGH PRESSURE TURBINE (HPT) − DESCRIPTION AND OPERATION

Task 72−52−00−990−002:

1. High Pressure Turbine

A. General

See Figures 1 and 2.

(1) The high pressure turbine (HPT) provides the rotational driving force for the high pressure compressor (HPC). This is done by extracting some of the energy from the hot combustion gasses directed at the turbine rotors and transforming this energy into motional energy or work to drive the high pressure compressor. The high pressure turbine consists of 1st and 2nd stage turbine rotor assemblies, a case and vane assembly and an inner airseal. All of these items are housed within the turbine case. Both of the turbine rotors, 2nd stage vanes and inner airseal are air cooled, as well as the turbine case which employs an air operated automatic turbine rotor clearance control system.

B. Stage 1 Turbine Rotor Assembly

(1) The 1st stage turbine rotor employs a nickel alloy hub and 60 single crystal material 1st stage turbine blades. Cooling air for the blades is metered by the cooling air duct in the turbine nozzle, through holes in the disk to the 1st stage rotor blades. Cooling air flows through blade passages for internal surface cooling and through a series of leading edge holes (showerhead holes) to provide film cooling for the airfoil external surfaces. See Figure 3 for typical blade internal cooling scheme.

(2) Blade tips are made of a hard material to lightly rub into the abradable ceramic, duct segments, (outer air seal) for efficient rotor sealing. Attached to the rotor hub on the forward side are two knife−edge seals, which mate with the 1st rotor cooling air duct seal lands, on the turbine nozzle group to seal the 1st stage blade cooling air supply. The Stage 2 HPT (rotating) airseal is attached to the rear of the turbine front hub. This rotating knife−edge seal is the 2nd stage vane inner gaspath seal and also functions as a spacer between the first and second rotors. The 1st stage rotor has an inner spline and mates directly to the rear compressor hub.

(Typical)
Figure 2
(Task 72−52−00−990−002)

(1) The turbine case and vane assembly consists of the turbine case, 21 segments each of the 1st stage HPT duct segments, 2nd stage vane clusters and 2nd stage HPT duct segments. Extensive sealing, primarily feather seals are incorporated between the vane clusters, outer air seal supports, and duct segments to reduce leakage from the gaspath and cooling air passages. The 1st and 2nd stage HPT duct segments incorporate an abradable ceramic coating for efficient sealing. The 2nd stage vane cluster outer buttress is retained to the turbine case by a tongue and groove fit. The rear OD vane cluster buttress is bolted to the rear inner flange of the turbine case. Cooling air for the 2nd stage vanes comes from the 12th compressor stage through four externally routed tubes which mount to bosses on the turbine case. The airflow is modulated to reduce the cooling airflow at cruise conditions for improved performance. The segmented honeycomb Stage 2 HPT airseal inner land and rotor rimseal lands are mounted on the ID of each of the 2nd stage vane clusters, to seal the inner area of the vanes from gaspath leakage around the vanes. These seals are cooled with air that flows through the 2nd stage vanes and through nozzles mounted on the ID of the vanes. See Figure 4 for typical vane internal cooling scheme.

D. Stage 2 Turbine Rotor

(1) The 2nd stage turbine rotor uses a nickel alloy hub splined in tandem behind the turbine front hub (Stage 1) on the rear compressor hub. The second rotor has 82 directionally solidified shroudless turbine blades which are air cooled from a mixture of 12th stage compressor air and air from the diffuser case. Cooling air for the 2nd stage rotor blades is modulated to reduce flow at cruise conditions in order to improve performance. Cooling air flows through the blade internal cavity surfaces to cool the airfoil. Hardened blade tips (as on the 1st stage blades) are incorporated to abrade the ceramic outer airseal ducts for efficient tip sealing. A single rear side plate ring engages a segmented flange to retain the 2nd stage blades in the hub, the sideplate ring is then locked in place to prevent circumferential movement. See Figure 5 for typical blade internal cooling scheme.

E. Automatic Turbine Rotor Clearance Control System

HIGH PRESSURE TURBINE (HPT) − DESCRIPTION AND OPERATION

(1) Automatic turbine rotor clearance control system tubes surround the external side of the turbine case and supply fan discharge air to cool the surface of the case during cruise power operation. This cooling results in shrinkage of the case, with decreased tip clearances between the blade tips and duct segments, resulting in an improved turbine efficiency.

HIGH PRESSURE TURBINE (HPT) - DISASSEMBLY-01

Task 72-52-00-030-001:

1. Disassemble High Pressure Turbine

A. Equipment And Materials Required

Special Tools:

PWA 3755 Pump, Hydraulic (Optional to PWA 29389)
PWA 28657 Sling
PWA 29389 Pump, Hydraulic
PWA 75028 Gage
PWA 76154 Adapters (Two Required)
PWA 76156 Adapters (Two Required)
PWA 85086 Arm
PWA 85087 Eye, Lifting
PWA 85088 Fixture, Support (Optional to PWA 88719)
PWA 85107 Fixture, Build
PWA 85111 Fixture
PWA 85247 Bracket, Handling (Two Required)
PWA 85854 Fixture
PWA 87022 Stand, Support
PWA 87885 Cutter
PWA 88643 Sling (Optional to PWA 88673)
PWA 88673 Sling
PWA 88719 Stand

B. Procedure

Subtask 72-52-00-000-000:

(1) If necessary, remove nuts and screws that attach PWA 86058 Retainer to the rear flange of the turbine case. Remove the retainer.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(2) Install PWA 85107 Fixture onto high pressure turbine. See Figure 501.

(a) If installed, remove rod and attached details, guide pilot, clamp and nuts from coupler. Remove nut and hydraulic cylinder. Remove plug.

(b) Remove 12 screws (501/11) securing plate (501/2) to piloting ring (501/8) of fixture. Remove retainer (501/10) and jaws (501/3).

(c) Loosen eight hand knobs (501/7) at center hub (501/9) of fixture and move piloting ring (501/8) rearward until it is flush with or above surface of center hub. Tighten eight hand knobs.

(d) Thread three .500−13 inch eyebolts into tapped holes in rear center hub of fixture. Attach standard three cable sling to eyebolts and position fixture onto rear of high pressure turbine.

(e) Secure outer flanges of fixture to high pressure turbine case using 26 detail screws (501/6) and spacers (501/5). Remove hoist and sling.

(f) Loosen eight hand knobs (501/7) at center hub and allow piloting ring (501/8) to slowly seat onto turbine rear hub. Tighten eight hand knobs to secure hub.

(g) Position four jaws (501/3) into center of fixture, locating lip of jaws in ID cutout of turbine hub. Lightly tighten screws (501/4) to secure jaws.

(h) Install retainer (501/10) into center of fixture to retain four jaws (501/4). Tighten four screw details of jaws.

(i) Install plate (501/2) to pilot ring (501/8) and secure with 12 screws (501/11).

(j) Thread the plug (501/1) into the plate (501/2).

(3) Using hoist, attach PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of fixture. Take up slack on sling cables.

(4) Using hoist, trunnion the high pressure turbine to rear end down position. Lower the assembly onto PWA 87022 Support Stand.

Subtask 72−52−00−030−052:

(5) Remove turbine hub lock. See Figure 502.

(a) Install spline (502/8) detail of PWA 85111 Fixture into ID of turbine intermediate hub (502/1).

(b) Align key (502/4) with keyway slot in spline and install flanged spline (502/5) into ID of turbine front hub (502/7).

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(c) Insert rod (502/2) through center of both spline details and thread into coupler (502/9) of PWA 85107 Fixture. Secure with nut (502/6).

(d) Connect PWA 75028 Gage and PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to the hydraulic cylinder of PWA 85107 Fixture.

(e) Actuate the hydraulic pump and apply load of 18,000 lbf. (80,068 N) to seat turbine front and intermediate hubs.

NOTE: For a 30 ton hydraulic cylinder, a hydraulic pump output of 2,493 psig (17,188.6 kPa) will apply a load of 18,000 lbf. (80,068 N).

NOTE: For a 60 ton hydraulic cylinder, a hydraulic pump output of 1,358 psig (9,363.1 kPa) will apply a load of 18,000 lbf. (80,068 N).

(f) Using access holes in flange spline, carefully remove turbine hub lock (502/3).

(g) Disconnect the hydraulic pump from the hydraulic cylinder (502/11).

(h) Carefully remove the nut (502/6).

(i) Remove the rod (502/2) from the coupler (502/9).

(j) Remove the flanged spline (502/5), turbine hub lock (502/3), and spline (502/8).

(k) Remove the coupler (502/9) and the hydraulic cylinder (502/11).

(l) Remove the plug (502/10) from the plate at the bottom of the fixture.

HIGH PRESSURE TURBINE (HPT) − DISASSEMBLY−01

(6) FOR THESE MODELS: 4152, 4156A, 4158
Remove the 1st stage turbine rotor using PWA 85854 Fixture. See Figure 503.

(a) FOR THESE MODELS: 4152, 4156A, 4158
Remove the engine bolts (503/3), washers (503/5), and nuts (503/6) that attach the 1st stage HPT airseal (503/1) to the turbine front hub (503/2). If you will not disassemble the rotor assembly, mark the class and the locations of the counterweights (503/4). Use Ink P05−026.

(b) FOR THESE MODELS: 4152, 4156A, 4158
Install the knurled shaft (504/6) into the threaded hole in the center of PWA 85854 Fixture. See Figure 504.

(c) FOR THESE MODELS: 4152, 4156A, 4158
Use a hoist to align the boltholes and install the fixture on 1st stage HPT airseal (504/4).

(d) FOR THESE MODELS: 4152, 4156A, 4158
Attach the fixture to the airseal with 20 screws (504/1), washers (504/2), and nuts (504/3).

(e) FOR THESE MODELS: 4152, 4156A, 4158
Thread the hydraulic cylinder (504/8) into the plate (504/7). Connect the PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to the hydraulic cylinder (504/8).

(f) FOR THESE MODELS: 4152, 4156A, 4158
Adjust the ram detail of PWA 85107 Fixture until it contacts the shaft (504/6).

(g) FOR THESE MODELS: 4152, 4156A, 4158
Operate the hydraulic pump to break the tight fit between the turbine hubs.

(h) FOR THESE MODELS: 4152, 4156A, 4158
Use a hoist to remove the rotor assembly. Remove shaft (504/6) from PWA 85854 Fixture. Put the rotor assembly on a pallet.

(i) FOR THESE MODELS: 4152, 4156A, 4158
Remove the screws (504/1), washers (504/2), and nuts (504/3) that attach the PWA 85854 Fixture to the turbine front hub. Remove the fixture from the hub.

(j) FOR THESE MODELS: 4152, 4156A, 4158
If you are not going to disassemble the rotor assembly, install the counterweights in their specified locations. Lubricate the engine bolts with Engine Oil P03−001. Install the airseal and counterweights with engine bolts, washers, and nuts. Tighten the bolts to 85 − 95 lb−in. (9.604 − 10.734 N.m). See Figure 503.

(7) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the 1st stage turbine rotor. See Figure 505.

(a) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the twenty four (24) bolts (505/1) that attach the 1st stage HPT airseal (505/3), the HPT flange spacer (505/4) and the applicable number of counterweights (505/2) to the turbine front hub (505/5). If you will not disassemble the rotor assembly, mark the class and the locations of the counterweights (505/2). Use Ink P05−026.

(b) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the inner airseal (505/3) and the flange spacer (505/4).

1 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the retaining ring of PWA 87390 Jackscrew Puller and move the puller jaws out.

2 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Position the puller on the turbine front hub (505/5).

3 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the puller locator plate in the hub.

4 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Move the puller jaws in and adjust the jackscrew until the puller lip of the jaws are behind the OD of the airseal.

5 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the puller ring over the jaws to keep the jaws in position.

6 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Turn the jackscrew and remove the airseal (505/3) and the spacer (505/4) from the hub.

HIGH PRESSURE TURBINE (HPT) − DISASSEMBLY−01

7 FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Keep the airseal and the spacer in an applicable container to prevent damage.

(c) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Install the knurled shaft (504/6) into the threaded hole in the center of PWA 85854 Fixture. See Figure 504.

(d) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Use a hoist to align the boltholes and install the fixture on turbine front hub (504/4).

(e) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Attach the fixture to the front turbine hub with twenty (20) screws (504/1). The washers (504/2) and nuts (504/3) are not needed for Phase III engines.

(f) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Thread the hydraulic cylinder (504/8) into the plate (504/7). Connect PWA 29389 Hydraulic Pump or PWA 3755 Hydraulic Pump to the hydraulic cylinder (504/8).

CAUTION: FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(g) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Adjust the ram detail of PWA 85107 Fixture until it contacts the shaft (504/6).

(h) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Operate the hydraulic pump to break the tight fit between the turbine hubs.

(i) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Use a hoist to remove the 1st stage turbine rotor assembly. Remove the shaft (504/6) from PWA 85854 Fixture. Put the 1st stage turbine rotor assembly on a pallet.

(j) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
Remove the screws (504/1) that attach PWA 85854 Fixture to the turbine front hub. Remove the fixture from the hub.

(k) FOR THESE MODELS: 4152−3, 4156A−3, 4158−3
If you are not going to disassemble the rotor assembly, install the counterweights in their specified locations. Do not tighten the bolts. Keep the airseal and the flange spacer with rotor assembly.

Subtask 72−52−00−030−053:

(8) Remove turbine case and vane assembly.

(a) Position two PWA 85247 Brackets 180 degrees apart between front and rear flanges of turbine case. Position brackets with dowel pins protruding through boltholes in rear flange of case. Install seven screws through boltholes in front flange of turbine case and into brackets. Tighten screws to secure brackets.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(b) Remove screws (501/6) and spacers (501/5) that secure the turbine case to PWA 85107 Fixture.

(c) Connect PWA 88643 or PWA 88673 Sling with two PWA 76154 Adapters to trunnion spools on PWA 85247 Brackets. Using hoist lift turbine case and trunnion to front end (smaller OD) down and place assembly on pallet. Remove hoist sling and brackets.

(9) Put a protective cardboard cover over the assembly to prevent damage to the vanes from unwanted materials. If necessary, you can use PWA 87885 Cutter to make the cardboard cover.

Subtask 72−52−00−030−054:

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(10) Remove the details of the PWA 85107 Fixture from the turbine intermediate hub (506/1). See Figure 506.

(a) Remove the hydraulic cylinder (506/4).

(b) Carefully remove the screws securing the plate (506/3) to the piloting ring (506/5). Remove the plate and the retainer (506/2) from the hub.

(c) Loosen the screws and remove the four jaws (506/6).

(11) Install PWA 85087 Eye onto the turbine intermediate hub (507/5). See Figure 507.

(a) Loosen the three locknuts (507/6). Turn the clamp assemblies (507/7) to align the pins so that they point toward the center of the lifting hub (507/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the hub (507/4). Hold the clamps in position and tighten the three locknuts (507/6) to hold the eye on the turbine hub.

(12) Remove the 2nd stage turbine rotor and put it on PWA 85088 Fixture or PWA 88719 Stand.

(a) Attach a hoist to PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the PWA 85087 Eye and secure it with the knurled nut and safety pin.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(b) Remove the 2nd stage turbine rotor assembly from PWA 85107 Fixture.

(c) Center the turbine intermediate hub and lower the rotor assembly onto the PWA 85088 Fixture or PWA 88719 Stand.

(d) Remove the hoist, arm, and eye.

HIGH PRESSURE TURBINE (HPT) − DISASSEMBLY−01

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(13) Using a hoist, attach the PWA 28657 Sling and two PWA 76156 Adapters, to the trunnion spools of the PWA 85107 Fixture. Using the hoist, remove the fixture from the stand. Remove the sling.

C. Postrequisites

(1) Disassemble 1st stage turbine rotor assembly per 72−52−01, Disassembly−01 Task 72−52−01−440−001.

(2) Disassemble 2nd stage turbine rotor assembly per 72−52−02, Disassembly−01 Task 72−52−02−440−001.

(3) Disassemble turbine case and vane assembly per 72−52−03, Disassembly−01 Task 72−52−03−040−001.

HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−01

Task 72−52−00−990−004:

1. General Inspection Requirements − High Pressure Turbine (HPT)

A. Organization Of Individual Part Or Subassembly Inspection Data

(1) Specific inspection functions for all significant parts/subassemblies are provided in individual Inspection/Check sections. Application of each inspection function is shown in Inspection/Check−00 for part/subassembly. Section designations and function descriptions are as follows.

(2) Inspection/Check−00 section contains, where applicable:

(a) Part number(s) for which the inspection data is applicable.

(b) Service Bulletin numbers applicable to part number(s).

(c) Inspection/Check numbers, data categories and applicability data.

(3) Inspection/Check−01, Preinspection Preparation, contains, where applicable:

(a) General inspection comments, notes, CAUTIONS, etc., which supplement data contained in this section.

(b) Identification of mechanical disassembly required prior to inspection.

(c) Identification of any surface treatment or coating removal, or other actions required prior to inspection.

(d) Identification of part/subassembly cleaning required prior to inspection.

(4) Inspection/Check−02, Nondestructive Inspection, contains the following nondestructive inspection methods, part/subassembly special attention areas and damage limits (as applicable):

(a) Fluorescent Penetrant Method

(b) Eddy Current Method

(c) Magnetic Particle Method

(d) X−ray Method

(e) Ultrasonic Method

(f) Hardness Check

(g) Other − As specified.

(5) Inspection/Check−03, Visual Inspection contains, where applicable:

(a) Visual inspection requirements which can be accomplished with or without magnification or special lighting (as specified).

NOTE: Use of inspection tools may be required as a supplement to visual inspection process.

(b) Allowable blending for visual damage, which may be accomplished within the inspection area.

NOTE: Blending requirement will also be shown in applicable repairs.

(6) Inspection/Check−04, Dimensional Inspection, contains, where applicable:

(a) Dimensional inspection requirements other than visual inspection. The requirements will include applicable fits and clearances, and other dimensional inspections necessary to ensure the part integrity and proper functioning.

(7) Inspection/Check−05, Functional Check Inspection contains, where applicable:

(a) Procedures, limits, and equipment used with any required functional checks (oil flow, air flow, leak, etc.).

(8) Inspection/Check−06, Inspection Postrequisites contains, references to procedures required to return part/subassembly to serviceable condition. References include the following, as required.

(a) Reassembly

(b) Protective coatings, sealants and/or lubricant reapplication

B. Thorough and intelligent part/subassembly inspection is of major importance in achieving efficient engine operation and satisfactory service life. Inspection personnel should be thoroughly familiar with inspection procedures, inspection tooling, limits associated with normal and, where applicable, unusual operating conditions, limits associated with repairs, and with inspection procedures published in Standard Practices Manual.

C. During preliminary inspection of part/subassembly, comparison with mating or adjacent parts may provide indication of source of wear or damage. This procedure may indicate requirement for additional disassembly and inspection.

D. During inspection, records should be kept of deviations beyond serviceable limits to determine: (a) if part/subassembly will be repaired or replaced, and (b) if part is reparable, which repairs are required. Suitable documentation should accompany part/subassembly with results of this determination.

E. Inspection of individual part/subassembly dimensions which are also in Fits and Clearances will include Fits and Clearance Reference Numbers and will show new part/subassembly dimension unless specifically stated otherwise. Inspection Frequency Requirements (IFR) codes (for IFR Code A parts only) are included with Reference Number data. If acceptable dimensional deviations or results of repair affect Fits and Clearances, suitable documentation should accompany part/subassembly to ensure check of fit or clearance at final assembly.

NOTE: Parts/subassemblies which deviate dimensionally from new part/subassembly values may be acceptable provided required fit or clearance is achieved at final assembly.

F. Dimensional inspection requirements will be accompanied by part/subassembly constraint data if such constraint requirements are required during part/subassembly manufacture. Adherence to constraint requirements when inspecting service operated parts/subassemblies should be dictated by experience. It is recommended that parts/subassemblies which do not meet dimensional inspection requirements in free state be constrained and re−measured prior to initiation of any repair or re−use activity.

G. Dimensional inspections of one detail of a subassembly, prior to removal from subassembly, may produce incorrect data due to constraint forces from mating details. If questionable data is obtained, subassembly should be disassembled and inspections repeated.

H. Dimensional inspection limits in inspection text provide continued use (as is) and, if applicable, repair limits. Parts/subassemblies which exceed both limits and nonreparable parts/subassemblies which exceed (as is) limits are unserviceable.

I. Inspections required to verify integrity of repair are contained within repair procedure. Unless otherwise stated, repaired part is expected to meet all inspection requirements contained in inspection text for part/subassembly.

J. Parts/subassemblies which do not require repairs except for those provided in Standard Practices Manual are identified by Chapter/Section/Subject Number 72−52−99 in cleaning table (Cleaning−01) and nondestructive inspection table (Inspection/Check−02). Determination of serviceability for those parts listed in 72−52−99 is limited to cleaning, non−destructive inspection, and the following:

   (1) Visually inspect parts/subassemblies for surface defects, deformations, cuts, improper threads or wrenching surfaces, incomplete or missing protective coatings or other damage which will prevent proper functioning and make part/subassembly unserviceable. Unserviceable parts/subassemblies should not be reinstalled. Repair unserviceable parts/subassemblies per Standard Practices Manual, as applicable.

   (2) Parts/subassemblies with crack indications to any length or depth detected by listed nondestructive inspection are unserviceable, and should not be reinstalled.

K. When new part/subassembly is to be installed and it is important that it be identified as to engine number or position in engine, mark it by appropriate method described in Marking of Parts, 70−11, Standard Practices Manual.

L. In order to eliminate confusion and to maintain consistent terminology, various physical conditions which might be encountered during inspection of parts/subassemblies and explanation of unusual causes of such conditions are defined in Physical Inspection, 70−31, Standard Practices Manual.

M. If inspection reveals it necessary to replace fitted spacer, tag spacer to indicate that replacement must be made with spacer of correct classification at assembly.

N. If text refers to superficial or shallow imperfection, following definitions apply:

    (1) A superficial imperfection is defined as a nick, dent, scratch, toolmark, etc., which disrupts the surface but does not appear to penetrate surface roughness texture.

    (2) A shallow imperfection appears to penetrate surface finish texture, but does not have a dark bottom and would not cause a 0.007 inch (.178 mm) radius stylus to hesitate if passed over it.

HIGH PRESSURE TURBINE (HPT) - INSPECTION/CHECK-03

Task 72-52-00-990-005:

1. Visual Inspection - High Pressure Turbine (HPT)
    A. For inspection requirements applicable to installed (accessible) parts of high pressure turbine (HPT) see 72-00-52, Inspection/Check-XX (Task 72-00-52-220-XXX).
    B. Visually inspect the high pressure turbine for obvious surface defects and/or deformations which will preclude proper functioning of any of the parts. If defects are noted on any of the parts see the individual part section for damage limits.

Previous Pageblock Return to Previous Menu Next Pageblock

HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−04

Task 72−52−00−990−001:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are located in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−04

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. Use trial assembly or similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131)	(−)	0.512 (13.005)	=	.005 (0.126)
0.527 (13.385)	(−)	0.508 (12.903)	=	.019 (0.482)

EXAMPLE 2

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

Ref. No.	I F R	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max

HIGH PRESSURE TURBINE (HPT) − INSPECTION/CHECK−04

Task 72−52−00−990−006:

1. Specific Fits And Clearances

A. General

(1) Reference numbers on figures indicate location of parts for which fits and clearances are specified. Description of, and limits for, these fits and clearances are found in tables of corresponding reference numbers.

(2) Unless otherwise specified, all fits are diametral except spline fits, which are calculated for chordal dimensions, and blade tip clearance, which is radial.

(3) Numbers in all columns shall be interpreted in inches, and (millimeters).

(4) Letter "T" following limits indicates tight fit.

(5) Description column provides nomenclature for part or parts concerned. Chapter/section/subject number identification for each part or assembly is included in parenthesis for reference purposes. Additional inspection information is provided in the specific manual sections identified.

(6) Fits and clearances requirement which affect an engine accessory or component have the designation CMM in parenthesis following the part nomenclature. This designation is used for components which are not assigned an Engine Manual chapter/section/subject number. Information concerning these parts is located in the appropriate Component Maintenance Manual (CMM).

B. Inspection Frequency Requirements

(1) IFR column provides Inspection Frequency Requirements. Letter Codes A, B or C located in IFR column indicate manner and frequency of inspection recommended for item identified by adjacent reference number, as applicable to normal or routine repair. Definitions for these codes are as follows:

IFR Code	Definition
A	Clearance or fit is calculated from part measurements at each assembly of parts. Part measurements taken and recorded at time of individual part inspection are considered equally as valid as measurements taken at time of part assembly.
B	Clearance or fit is estimated at each assembly of parts. similar means to estimate clearance or fit. Measurement of parts and calculation of actual fit or clearance is required only if estimating procedure indicates that clearance or fit can be outside specified tolerance.
C	Clearance or fit is not subject to change in normal engine operation.

C. New Part Reference Dimensions

(1) Dimensions are provided in this column for reference only.

(2) Dimensions are the Minimum and Maximum manufacturing values in inches (and millimeters) for each part listed in the description column.

D. Limits

(1) Limits applicable to any combination of new or used parts.

(a) This column provides the acceptable (minimum − maximum) range of fit or clearance in inches (and millimeters). These limits may be applied to any combination of new or used parts.

(b) The limits are based on the mathematical combination of the minimum and maximum values specified in the New Part Reference Dimensions column. See Example 1.

(c) Limits which have been expanded to be less restrictive than new part conditions are identified with an asterisk (*) adjacent to the value. See Example 2.

EXAMPLE 1

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)

NOTE: In Example 1 limits are determined by comparing bearing and support referenced dimensions as follows:

0.517 (13.131) (−) 0.512 (13.005) = .005 (0.126)

0.527 (13.385) (−) 0.508 (12.903) = .019 (0.482)

EXAMPLE 2

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.020* (0.508)*

NOTE: In Example 2 limits represent less restrictive values as indicated by the asterisk(*).

(2) Limits for selective application to engines scheduled for partial refurbishment.

(a) A second set of limits enclosed by brackets and lines may be provided. See Example 3. These enclosed limits are less restrictive and are intended to be selectively applied to engines scheduled for partial refurbishment.

EXAMPLE 3

Ref. No.	IFR	Description	New Part Reference Dimensions Min	New Part Reference Dimensions Max	Limits Min	Limits Max
1812		Bearing	0.508 (12.903)	0.512 (13.005)		
		Support	0.517 (13.131)	0.527 (13.385)	0.005 (0.126)	0.019 (0.482)
					[.005 [(0.13)	.022] (0.56)]

NOTE: In Example 3 the enclosed (less restrictive) limits are intended for selective application, see text.

E. Part Dimensions

(1) Detail part dimensions that measure outside the Reference dimensions of the Table Of Limits are permissible if the related Fit/or Clearance with the mating part is in limits. The part must also be in limits for any allowable growth/or shrinkage.

F. Fits And Clearances

HIGH PRESSURE TURBINE (HPT) - ASSEMBLY-01

Task 72-52-00-400-001:

1. Assemble High Pressure Turbine

A. Prerequisites

(1) See Inspection/Check-04 Task 72-52-00-990-001 for fits and clearances. Special torques and special assembly procedures appear where necessary in the following text and are identified by a reference number. For example: (Reference 1234) Torque retaining nut as follows.

(2) Assemble 1st stage turbine rotor assembly per 72-52-01, Assembly-01 Task 72-52-01-440-001.

(3) Assemble 2nd stage turbine rotor assembly per 72-52-02, Assembly-01 Task 72-52-02-440-001.

(4) Assemble turbine case and vane assembly per 72-52-03, Assembly-01 Task 72-52-03-440-001.

B. Equipment And Materials Necessary

Standard Tools:

Name	Manufacturer
Clements Cadillac Electric Flameless Heat Gun Model FT 1000	Clements Manufacturing Co. 6650 S. Narragansett Avenue Chicago, IL 60638

NOTE: The flameless torch specified above is optional to the heaters specified in the Special Tools list, and the optional flame torch.

Special Tools:

PWA 28657	Sling
PWA 29389	Pump, Hydraulic
PWA 29754	Control, Heater
PWA 75028	Gage
PWA 76154	Adapter (Two Necessary)
PWA 76156	Adapters (Two Necessary)
PWA 85083	Eye, Handling (Optional to PWA 85087)
PWA 85085	Plate, Trunnion (Optional to PWA 86080)
PWA 85086	Arm, Lifting (Two Necessary)
PWA 85087	Eye, Lifting
PWA 85107	Fixture, Build
PWA 85111	Fixture, Align

Special Tools:

(CONTINUED)

PWA 85112	Fixture, Retain (Optional)
PWA 85247	Bracket, Handling (Two Necessary)
PWA 85634	Fixture, Support
PWA 86023	Pin, Guide (Four Necessary)
PWA 86058	Retainer, Storage (Optional)
PWA 86080	Eye, Lifting
PWA 86208	Crimper, Manual
PWA 87022	Stand, Build
PWA 87487	Heater, Electrical
PWA 88643	Sling (Optional to PWA 88673)
PWA 88673	Sling (Optional to PWA 88643)

Consumable Materials:

Item No.	Designation
P05−395	Beeswax
P05−396	Paraffin Wax Blend
P08−010	Adhesive (EC−1300)
P08−005	Adhesive (PWA 36027)
P08−022	Adhesive (EC−1357)

Expendable Parts:

PART NAME	QUANTITY	PARTS CATALOG REFERENCE SECTION/FIGURE/ITEM
Seal	1	72−52−00/6/1

C. General Assembly Requirements

(1) Where heating is required for assembly, use minimum temperature differential of 125°F (52°C) between parts being assembled. Do not exceed 300°F (149°C) on any part.

(2) Where heating is required for assembly, special heaters are specified in the following procedure. However, you can use an optional flameless torch or flame torch as specified in the following steps.

(3) In locations where heating of a component in an oven is not practical or only a flange of the component requires heating, the use of Clements Cadillac Quic Heat flameless torch, Model FT 1000 is recommended.

(4) Alternate, flame torch heating method for tight fitting disks hubs, and shafts:

WARNING: WEAR GLOVES WHEN YOU HANDLE HOT PARTS TO AVOID BURNS.

CAUTION: HEAT PARTS EVENLY. DO NOT EXCEED THE MAXIMUM TEMPERATURE LIMITS IN ANY LOCAL AREA. IF THE TEMPERATURE IS MORE THAN THE MAXIMUM LIMIT, IT WILL CAUSE DAMAGE TO THE PART.

CAUTION: DO NOT PERMIT THE FLAME TO COME IN CONTACT WITH ANY NON−METAL PART. THE FLAME WILL DAMAGE OR BURN NON−METAL PARTS.

CAUTION: DO NOT USE A TORCH HEAD THAT HAS A PENCIL POINT FLAME.

(a) Use a flame torch that has a maximum output of 80,000 BTU an hour, with a torch head that has a soft, equally spread, lapping flame.

CAUTION: DO NOT USE ANY MARKING METHOD THAT LEAVES A DEPOSIT OF CARBON, ZINC, COPPER, LEAD, OR SIMILAR RESIDUE WHICH CAN CAUSE A REDUCTION IN FATIGUE STRENGTH AS A RESULT OF CARBURIZATION OR INTERGRANULAR ATTACK WHEN THE PART IS SUBJECTED TO INTENSE HEAT.

(b) Use the flame torch as follows:

1 Continually monitor the temperature of the part. Use a temperature indicator such as a digital pyrometer or heat sensitive crayon.

NOTE: The digital pyrometer is a more effective temperature indicator and is preferred. However, the heat sensitive crayon can be used.

2 Evenly heat the part in the snap diameter area by part rotation or move the torch around the part.

3 Continually monitor the temperature of the part.

4 Apply only enough heat to expand the tight diameters as needed.

D. Procedure

CAUTION: (PRE SB PW4ENG 72-712) IF ONE OR MORE NEW 1ST OR 2ND STAGE DUCT SEGMENTS ARE INSTALLED, A MINIMUM OF 30 1ST AND/OR 2ND STAGE BLADES, AS APPLICABLE, MUST BE INSTALLED THAT HAVE ACCEPTABLE BLADE TIP ABRASIVE. FAILURE TO REPLACE BLADE TIP ABRASIVE PARTICLES WILL DECREASE ENGINE PERFORMANCE AND CAUSE MORE BLADE TIP WEAR THAN THE REPAIR LIMITS ALLOW.

CAUTION: (PRE SB PW4ENG 72-712) IF NO NEW DUCT SEGMENTS ARE INSTALLED AND ONE OR MORE 1ST OR 2ND STAGE DUCT SEGMENTS PRETRENCHED PER PW4000 Series CIR, PN 51A357 REPAIR-02, SECTION 72-52-32 OR 72-52-35 ARE INSTALLED, THE REQUIREMENTS FOR 30 BLADES WITH SUITABLE BLADE TIPS IS WAIVED.

CAUTION: (POST SB PW4ENG 72-712) IT IS RECCOMENDED A FULL SET OF 60 1ST STAGE BLADES ARE INSTALLED TO GET THE BEST PERFORMANCE, BUT IF THEY ARE NOT AVAILABLE, A MINIMUM OF 30 1ST STAGE BLADES WITH EXPOSED GRIT TIP ARE NECESSARY TO GIVE ADEQUATE SEAL CUTTING. THE BLADES MUST BE INSTALLED DIAMETRICALLY OPPOSED FROM EACH OTHER. FAILURE TO DO SO WILL DECREASE ENGINE PERFORMANCE AND CAUSE MORE BLADE TIP WEAR.

Subtask 72-52-00-430-060:

(1) Before you assemble the high pressure turbine it is necessary to find the 1st and 2nd stage blade tip clearances. See 72-52-00, Inspection/Check-04 Task 72-52-00-990-004, References 1740 and 1741 respectively, for blade tip clearances. See Figure 1001.

NOTE: Optional, blade tip clearance can be checked with the use of feeler stock after you complete the assembly of the High Pressure Turbine.

(a) Using pi tape or equivalent, measure OD of 1st and 2nd stage turbine rotor assemblies and record dimensions.

(b) Using pi tape or equivalent, measure ID of 1st and 2nd stage HPT duct segments. For used duct segments measurement must be taken in blade rub groove of ducts.

(c) Using dimensions determined above, calculate average blade tip clearance for 1st and 2nd stage rotor assemblies.

(d) Blade tip clearances must be in the limits specified in Reference 1740 for the 1st stage rotor and Reference 1741 for the 2nd stage rotor. See 72−52−00 Inspection/Check−04 (Task 72−52−00−990−004).

Subtask 72−52−00−430−051:

(2) Install PWA 85107 Fixture onto PWA 87022 Stand. See Figure 1002.

(a) Insure that locating plug (1002/1), with the triple step end up, is installed in center sleeve unit of stand. Completely lower center sleeve unit using jackscrew (1002/5).

(b) If required, remove threaded rod from coupler detail of PWA 85107 Fixture. Remove hydraulic cylinder, plate, and coupler. Remove center retainer and jaws.

(c) Using hoist, connect PWA 28657 Sling with two PWA 76156 Adapters to trunnion spools of PWA 85107 Fixture. Position fixture rear, smaller OD, end down onto stand.

(d) Adjust jackscrew of stand to support pilot ring (1002/2).

(e) For engines (Pre SB PW4ENG 72−176), remove the PWA 86379 Adapter Ring, if installed, from the pilot ring detail of PWA 85107 Fixture.

CAUTION: THE SCREWS THAT HOLD THE PWA 86379 ADAPTER RING MUST BE FLUSH WITH THE ADJACENT SURFACE OR DAMAGE TO THE PARTS CAN OCCUR.

(f) For engines (Post SB PW4ENG 72−176), install the PWA 86379 Adapter Ring, if not installed, on the pilot ring detail of PWA 85107 Fixture. Use six detail cap screws to hold the adapter ring.

NOTE: The turbine intermediate hub, (Post SB PW4ENG 72−176) has a shorter inner hub. The adapter is required with the fixture to set the axial run position on the HPT rotor.

(3) Set axial running position, 1.951 inch (49.555 mm) dimension on fixture.

(a) Lightly loosen eight hand knobs (1002/3) that hold the pilot ring.

(b) Use the jackscrew assembly of the stand to raise or lower the pilot ring of the fixture. Pull and release the T−handle (1002/4) to locate in the slot of the pilot ring.

(c) Secure pilot ring with hand knobs (1002/3).

(d) Pull T−handle locator pin to disengage it from pilot ring.

(e) Lower jackscrew of stand.

Subtask 72−52−00−430−052:

(4) Install PWA 85087 Eye into the front end of the turbine intermediate hub (1003/5). See Figure 1003.

(a) Loosen the three locknuts (1003/6). Turn the clamp assemblies (1003/7) to align the pins so that they point toward the center of the lifting hub (1003/4).

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub (1003/4). Hold the clamps in position and tighten the three locknuts (1003/6) to hold the eye on the turbine hub.

(5) Attach a hoist to PWA 85086 Arm. Remove the safety pin (1003/3) and knurled nut (1003/2) from the arm. Connect the arm to the lifting hole (1003/1) of the PWA 85087 Eye, and secure it with the knurled nut and safety pin.

CAUTION: SECOND STAGE TURBINE ROTORS THAT INCORPORATE TURBINE INTERMEDIATE HUB PN 50L902 REQUIRE INCREASED 2ND STAGE BLADE TIP CLEARANCE. REFERENCE SB PW4ENG 72−176.

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(6) Use the hoist to position the 2nd stage turbine rotor assembly onto PWA 85107 Fixture. Remove the eye and arm from the hub.

(7) Install details of PWA 85107 Fixture. See Figure 1004.

(a) Install four jaws (1004/9), with larger flange end down, through bore of hub. Engage upper flange of jaws with lip above hub bore. Lightly tighten detail modified screws to secure jaws.

(b) Lower the jack assembly of the stand.

(c) Align dowel pins between jaws and insert retainer (1004/2), with spring loaded pin end down into hub and center of jaws. Tighten the modified screws to attach the jaws.

(d) If required, thread plug (1004/7) into plate (1004/4). Align dowel pin with mating hole and install plate to pilot ring (1004/8). Secure plate with 12 screws.

(e) Insert coupler (1004/3), with threaded OD end down, through hub and hole in plug (1004/7).

(f) Install hydraulic cylinder (1004/5), with threaded−end up, onto coupler and attach it with a spacer and nut (1004/6).

(8) Install 2nd stage HPT airseal (1005/1) onto turbine intermediate hub. See Figure 1005.

(a) Locate channel formed by 2nd stage HPT covers (1005/6) and OD of turbine intermediate hub (1005/3).

(b) Install airseal into channel between hub OD and covers, with airseal overlap area (1005/5) positioned at any blade root (1005/4) location.

(c) Airseal must contact all hub OD (1005/2) locations, 82 places. Use PWA 86208 Crimper to crimp the airseal as necessary. Airseal may be crimped (1005/7) at any blade root (1005/2) location, as required, to provide hub OD contact.

Subtask 72−52−00−430−053:

CAUTION: THE INNER PILOTING RING OF THE PWA 85107 FIXTURE DOES NOT HAVE A POSITIVE STOP FEATURE AND CAN FALL ACCIDENTALLY FROM THE FIXTURE.

(9) Install turbine case and vane assembly onto PWA 85107 Fixture.

(a) Install two PWA 86023 Guide Pins into the threaded holes in each side of the outer ring segment details of PWA 85107 Fixture. See Figure 1004.

(b) With turbine case front flange (smaller ID) down, position two PWA 85247 Brackets 180 degrees apart between front and rear flanges of case. Position brackets with dowel pins protruding through bolthole in rear flange of case. Install seven screws through boltholes in front flange of turbine case and into brackets. Tighten screws.

(c) Connect PWA 88643 Sling or PWA 88673 Sling with two PWA 76154 Adapters to trunnion spools on PWA 85247 Brackets. Using hoist, lift assembly and trunnion to rear end (larger OD) down position. Lower assembly over rotor assembly and onto PWA 85107 Fixture.

(d) Disconnect hoist, sling and adapters. Allow brackets to remain in place.

(e) Remove PWA 86023 Guide Pins and secure the turbine case to the fixture with 26 screws and spacers.

Subtask 72−52−00−430−054:

(10) Position PWA 85634 Fixture on the workbench.

(11) Trunnion the front turbine hub to the front end down position. Use PWA 85087 Eye and PWA 86080Eye. See Figure 1006.

NOTE: See the following step to trunnion the hub with optional PWA 85083 Eye and PWA 85085 Plate.

(a) Loosen the three locknuts (1006/5) of PWA 85087 Eye. Turn the clamp assemblies (1006/9) to align the pins so that they point toward the center of the lifting hub.

(b) Install the eye into the turbine hub. Turn the clamp assemblies into the turbine hub and align the pins so that they point toward the "LOCKED POSITION" marks on the lifting hub (1006/4). Hold the clamps in position and tighten the three locknuts (1006/5) to hold the eye on the turbine hub.

(c) Attach a hoist to PWA 85086 Arm. Remove the safety pin (1006/3) and knurled nut (1006/2) from the arm. Connect the arm to the lifting hole (1006/1) of the PWA 85087 Eye, and secure it with the knurled nut and safety pin. Use the hoist to lift the assembly.

(d) Align the lifting hole of PWA 86080 Eye with the lifting hole of PWA 85087 Eye, and the posts (1006/6) with the mating holes in PWA 86080 Eye.

(e) Install the applicable (shorter) bolts (1006/7) to hold the PWA 86080 Eye.

(12) Optional, trunnion the front turbine hub to the front end down position. Use PWA 85083 Eye and PWA 85085 Plate. See Figure 1006.

(a) Rotate the outer sleeve (1006/12) and separate the outer sleeve from the inner ring (1006/10).

(b) Position the inner ring onto the turbine front hub with three jaws (1006/11) behind the step on the OD of the hub.

(c) Position the outer sleeve over the inner ring. Align the three dowel pins (1006/14) in the inner ring with the mating slots in the outer sleeve.

(d) Rotate the outer sleeve to position the dowel pins in the bottom of the slots. Align the scribed alignment marks (1006/13) on the outer sleeve with the scribed lines on the dowel pins.

(e) Attach a hoist to PWA 85086 Arm. Remove the safety pin and the knurled nut from the arm. Connect the arm to the lifting hole of the eye, and secure it to the eye with the knurled nut and safety pin. Use the hoist to lift the assembly.

(f) Position PWA 85085 Plate into the rear ID of the hub. Align the boltholes and thread two bolts (1006/15) into the detail nuts on the upper end of PWA 85083 Eye. Tighten the bolts to secure the plate.

(13) Attach a hoist to a second PWA 85086 Arm. Remove the safety pin and knurled nut from the arm. Connect the arm to the lifting hole of the eye or plate as applicable and secure it with the knurled nut and safety pin.

(14) Use the hoists to trunnion the hub to front end down position. Remove the lower arm and hoist. Lower the hub into the PWA 85634 Fixture. Remove the upper arm and hoist.
